Namespace Index

1.1 Packages

Here are the packages with brief descriptions (if available):

Timetable_Optimisation_Recommendations	9
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface	9
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses	11
Timetable_Optimisation_Recommendations.Pages	11
Timetable_Optimisation_Recommendations.Properties	12
Timetable_Optimisation_Recommendations.Request_Manager	12
Timetable_Optimisation_Recommendations.Route_Analyser	12
Timetable_Optimisation_Recommendations.Search_Algorithm	12
Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search	12
Timetable_Optimisation_Recommendations.Timetable_Analyser	13
Timetable_Optimisation_Recommendations.Timetable_Evaluator	13
Timetable_Optimisation_Recommendations.Timetable_Performance_Evaluator	14
Timetable_Optimisation_Recommendations.Timetable_Simulator	14
Timetable_Optimisation_Recommendations.UserControls	14
Timetable_Optimisation_Recommendations.Windows	15

Chapter 2

Hierarchical Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

Application	
Timetable_Optimisation_Recommendations.App	19
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusOperatorFactory	25
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.CacheWriter	29
Timetable_Optimisation_Recommendations.Timetable_Analyser.Cluster	30
Timetable_Optimisation_Recommendations.Timetable_Analyser.Group.DateSpan	35
Timetable_Optimisation_Recommendations.Timetable_Analyser.Group	41
Timetable_Optimisation_Recommendations.Windows.Highlight	44
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator	46
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBus↔Operator	85
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator	119
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusService	49
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusService	89
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusStop	54
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusStop	92
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable	56
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusTimeTableStub	27
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusHistoricTimeTable	45
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.Rb↔TimeTableHistoric	98
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusSolidHistoricTimeTable	53
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.Rb↔TimeTableSolidHistoric	99
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbTimeTable	95
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.Rb↔TimeTableHistoric	98
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.Rb↔TimeTableSolidHistoric	99
Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable	20
ICloneable	
Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.Solution	115
Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable	20
Timetable_Optimisation_Recommendations.Timetable_Evaluator.Weights	134

INotifyPropertyChanged	
Timetable_Optimisation_Recommendations.ProgressReporting	82
Timetable_Optimisation_Recommendations.AdvancedProgressReporting	17
Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion< TResult >	72
Timetable_Optimisation_Recommendations.Timetable_Simulator.JourneyTime	60
Timetable_Optimisation_Recommendations.Timetable_Performance_Evaluator.LatenessRecord	63
Timetable_Optimisation_Recommendations.Timetable_Performance_Evaluator.LatenessReport	64
Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.Move	67
Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.MoveSelector	68
NavigationWindow	
Timetable_Optimisation_Recommendations.Windows.MainWindow	67
Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.NeighbourhoodSolution	71
Page	
Timetable_Optimisation_Recommendations.Pages.DateSelector	34
Timetable_Optimisation_Recommendations.Pages.Evaluator	40
Timetable_Optimisation_Recommendations.Pages.MainPage	66
Timetable_Optimisation_Recommendations.Pages.MovesMade	70
Timetable_Optimisation_Recommendations.Pages.PreliminaryDataDownload	79
Timetable_Optimisation_Recommendations.Pages.PreviousPerformance	80
Timetable_Optimisation_Recommendations.Pages.RouteSegmentSelector	109
Timetable_Optimisation_Recommendations.Timetable_Performance_Evaluator.PerformanceEvaluator	76
Timetable_Optimisation_Recommendations.Timetable_Evaluator.PreEvaluatorChecks	78
Timetable_Optimisation_Recommendations.Properties.Resources	100
Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegment	102
Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegmentCollection	104
Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegmentFinder	107
Timetable_Optimisation_Recommendations.Timetable_Evaluator.ServiceCohesionEvaluator	111
Timetable_Optimisation_Recommendations.Timetable_Evaluator.SlackTimeEvaluator	113
Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.TabuList	122
Timetable_Optimisation_Recommendations.Timetable_Simulator.TimeSimulator	124
Timetable_Optimisation_Recommendations.Timetable_Simulator.DwellTimeSimulator	39
Timetable_Optimisation_Recommendations.Timetable_Simulator.JourneyTimeSimulator	61
Timetable_Optimisation_Recommendations.Timetable_Evaluator.TimeTableEvaluator	127
Timetable_Optimisation_Recommendations.Timetable_Analyser.TimeTableGrouper	129
Timetable_Optimisation_Recommendations.Request_Manager.TimetableRetrieval	130
UserControl	
Timetable_Optimisation_Recommendations.UserControls.ClusterCard	33
Timetable_Optimisation_Recommendations.UserControls.LatenessSummary	65
Timetable_Optimisation_Recommendations.UserControls.ServiceCard	110
Window	
Timetable_Optimisation_Recommendations.Windows.Settings	112
Timetable_Optimisation_Recommendations.Windows.ViewTimetable	132
Timetable_Optimisation_Recommendations.Windows.ViewTimetableHighlighted	133

Chapter 3

Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

Timetable_Optimisation_Recommendations.AdvancedProgressReporting	
Advanced Progress Reporting, is used to report back to the GUI on the progress of a more complex task that contains sub-tasks	17
Timetable_Optimisation_Recommendations.App	
Interaction logic for App.xaml	19
Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable	
A "blamed" bus timetable is a timetable record that also contains weights and blame values, from squeaky wheel optimization. Along with the logic for updating the scheduled times	20
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusOperatorFactory	
A singleton factory object, that can produce and return back the current IBusOperator object. This allows for support of several bus operators, not just Reading Buses. You would set the operator you want to get data for and the factory will then return a singleton reference to the operator object	25
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusTimeTableStub	
Used when you need to problematically make a new IBusTimetable record, for example when you are making a new timetable during the evaluator	27
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.CacheWriter	
Used to write a cache files to the disk	29
Timetable_Optimisation_Recommendations.Timetable_Analyser.Cluster	
A cluster is a selection of dates which all have the same timetable. A group is a span of consecutive days within the cluster, that all have this same timetable	30
Timetable_Optimisation_Recommendations.UserControls.ClusterCard	
The card used to show a timetable cluster and the groupings within it	33
Timetable_Optimisation_Recommendations.Pages.DateSelector	
The date selector page, this is where the user is asked to input a a date range, for which they intend upon making a new timetable for	34
Timetable_Optimisation_Recommendations.Timetable_Analyser.Group.DateSpan	
A class used to represent a date span, which is a period between two dates	35
Timetable_Optimisation_Recommendations.Timetable_Simulator.DwellTimeSimulator	
Used to calculate how long a bus is going to need to dwell at a bus stop, given the time of day and hence changes in passenger demand. Can be considered how busy a stop is	39
Timetable_Optimisation_Recommendations.Pages.Evaluator	
The actual main evaluator stage of the program, this is the GUI for the "main part". But the page mainly contains the GUI to let the user know of the progress	40
Timetable_Optimisation_Recommendations.Timetable_Analyser.Group	
A group is a collection of consecutive days within a cluster	41

Timetable_Optimisation_Recommendations.Windows.Highlight	
Used to tell the timetable data grid what colour highlights the cells should be	44
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusHistoricTimeTable	
Used to store a historical time table record, which is an actual record for when a single bus arrive at a stop	45
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator	
Provides all the information about a bus operator and gives the ability to query it further	46
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusService	
A class which represents a single bus service	49
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusSolidHistoricTimeTable	
Used to store a historical time table record, which is an actual record for when a single bus arrive at a stop. Solid, contains only records that had actual values recorded. Any non-solid record does not necessarily contain values	53
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusStop	
A class which represents a single bus stop	54
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable	
A class which represents a single time table record, this is a time and particular bus stop for one service	56
Timetable_Optimisation_Recommendations.Timetable_Simulator.JourneyTime	
A simplistic class used to help represent the journey time between two stops	60
Timetable_Optimisation_Recommendations.Timetable_Simulator.JourneyTimeSimulator	
The journey time simulator class takes in a theoretical departure time, two stops to travel between and some other information. It then estimates how long it would likely take to travel between the two stops at this time of day	61
Timetable_Optimisation_Recommendations.Timetable_Performance_Evaluator.LatenessRecord	
Used to represent the lateness of one single record	63
Timetable_Optimisation_Recommendations.Timetable_Performance_Evaluator.LatenessReport	
Used for MVVM to bind to the GUI, this contains data summerising the performance of a service	64
Timetable_Optimisation_Recommendations.UserControls.LatenessSummary	
The lateness summary report card, shows the performance of the service historically	65
Timetable_Optimisation_Recommendations.Pages.MainPage	
The main start page for the program, this is where the user will select the primary service that they wish to optimize for	66
Timetable_Optimisation_Recommendations.Windows.MainWindow	
The main entry point for the application, but the logic is contained within the page	67
Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.Move	
Used to represent a single move of the search algorithm, this involves making a change to one services timetable, on one running-board. A single timetable record is moved and then the surrounding records will also need to be edited in forwards and backwards propagation	67
Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.MoveSelector	
The move-selector is used to select the best move out of an array of moves, the neighborhood, to generate a new solution	68
Timetable_Optimisation_Recommendations.Pages.MovesMade	
Used to display the moves that have been made by the search algorithm after it has completed and displays the finalized timetables	70
Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.NeighbourhoodSolution	
Used to generate the neighbourhood of solutions for the search algorithm	71
Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion< TResult >	
Helper class to wrap around a Task to provide more information usable for UI databinding scenarios. As discussed in MSDN Magazine: https://msdn.microsoft.com/magazine/dn605875	72
Timetable_Optimisation_Recommendations.Timetable_Performance_Evaluator.PerformanceEvaluator	
A class used to generate the performance of the historical/current timetables	76
Timetable_Optimisation_Recommendations.Timetable_Evaluator.PreEvaluatorChecks	
Pre-evaluator checks is run before actually running the real evaluator and is used to download all of the data that is required and evaluate the performance of the old timetable	78

Timetable_Optimisation_Recommendations.Pages.PreliminaryDataDownload	
The preliminary data download lets you download all of the data files that you are going to need for the search. It also lets you see the services past performance	79
Timetable_Optimisation_Recommendations.Pages.PreviousPerformance	
Once all of the data has been downloaded in the pre-evaluator checks show the performance metrics to the user. This is the final stage before starting the actual search	80
Timetable_Optimisation_Recommendations.ProgressReporting	
Used to report back the progress of th task to the GUI	82
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusOperator	
An Implementation of the IBusOperator interface for the Reading Buses API	85
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusService	
An Implementation of the IBusService interface for the Reading Buses API	89
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusStop	
An Implementation of the IBusStop interface for the Reading Buses API	92
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbTimeTable	
An Implementation of the IBusTimetable interface for the Reading Buses API	95
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbTimeTableHistoric	
An Implementation of the IBusHistoricTimetable interface for the Reading Buses API	98
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbTimeTableSolidHistoric	
An Implementation of the IBusSolidHistoricTimeTable interface for the Reading Buses API	99
Timetable_Optimisation_Recommendations.Properties.Resources	
A strongly-typed resource class, for looking up localized strings, etc	100
Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegment	
Route Segment is set of consecutive stops that two services share, the primary service, identified in the RouteSegmenetFinder and the secondary service that also shares it	102
Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegmentCollection	
The RouteSegmentCollection class manages the results of the RouteSegmentFinder , and provides the logic for part of the GUI, which lets the user add or remove a service of interest	104
Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegmentFinder	
The route segment finder class takes in a Bus Service (known as the primary service) and a tolerance. It then finds any service which shares a common-route segment with it, to the specified minimum segment length tolerance	107
Timetable_Optimisation_Recommendations.Pages.RouteSegmentSelector	
The route-segment selector page finds other services that share a common route-segment with the primary service. And then allows the user to accept secondary services to also optimism their timetables for	109
Timetable_Optimisation_Recommendations.UserControls.ServiceCard	
The service card, use to display the single service	110
Timetable_Optimisation_Recommendations.Timetable_Evaluator.ServiceCohesionEvaluator	
The service cohesion evaluator works with the Evaluator class to calculate how well a services timetable works, with another service that shares a common route segment. By assigning a blame value to each timetable record based on how un-cohesive it is	111
Timetable_Optimisation_Recommendations.Windows.Settings	
The main settings page for the application	112
Timetable_Optimisation_Recommendations.Timetable_Evaluator.SlackTimeEvaluator	
The slack time evaluator works with the Evaluator class to calculate if the timetable has excessive slack (Or not enough). By assigning a blame value to each timetable record based on how disruptive it is to the timetable	113
Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.Solution	
Used to represent a single solution to the problem, the actual solution is stored in a dictionary, where the service is the key and an array of timetable records is the value	115
Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator	
The default operator if none is selected, this is mainly used to satisfy the null-ability requirement of C# then anything else	119
Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.TabuList	
TabuList keeps track of what moves are tabu/invalid and what moves can now be performed. Moves are tabu while the tabu tenure is greater than zero	122

Timetable_Optimisation_Recommendations.Timetable_Simulator.TimeSimulator	
Shared common code used between both the Journey Time Simulator and the Dwell Time Simulator. Manila the weighted averaging code and accuracy measures	124
Timetable_Optimisation_Recommendations.Timetable_Evaluator.TimeTableEvaluator	
The main evaluator entry point, give it a set of dates where you want to use data from, an initial starting solution and a route-segment collection and then it can improve upon the timetable . .	127
Timetable_Optimisation_Recommendations.Timetable_Analyser.TimeTableGrouper	
The grouper class can be used to help find patterns in the timetable where several days shared the same timetable	129
Timetable_Optimisation_Recommendations.Request_Manager.TimetableRetrieval	
Used to get a batch/ multiple-days worth of timetable data in a single query. However, this still has to be done sequentially because the Reading Buses API doesn't like having more than one database connection open at once	130
Timetable_Optimisation_Recommendations.Windows.ViewTimetable	
Used to display the timetable to the user	132
Timetable_Optimisation_Recommendations.Windows.ViewTimetableHighlighted	
Interaction logic for ViewTimetable.xaml	133
Timetable_Optimisation_Recommendations.Timetable_Evaluator.Weights	
The weights class is used to store a target arrival and departure time, along with a raw and standardised weight for how much it should pull towards it	134

Chapter 4

Namespace Documentation

4.1 Timetable_Optimisation_Recommendations Namespace Reference

Classes

- class [AdvancedProgressReporting](#)
Advanced Progress Reporting, is used to report back to the GUI on the progress of a more complex task that contains sub-tasks.
- class [App](#)
Interaction logic for App.xaml
- class [ProgressReporting](#)
Used to report back the progress of th task to the GUI.

4.2 Timetable_Optimisation_Recommendations.Bus_Operator_API_↔ Interface Namespace Reference

Classes

- class [BusOperatorFactory](#)
A singleton factory object, that can produce and return back the current [IBusOperator](#) object. This allows for support of several bus operators, not just Reading Buses. You would set the operator you want to get data for and the factory will then return a singleton reference to the operator object.
- class [BusTimeTableStub](#)
Used when you need to problematically make a new [IBusTimetable](#) record, for example when you are making a new timetable during the evaluator.
- class [CacheWriter](#)
Used to write a cache files to the disk.
- interface [IBusHistoricTimeTable](#)
Used to store a historical time table record, which is an actual record for when a single bus arrive at a stop.
- interface [IBusOperator](#)
Provides all the information about a bus operator and gives the ability to query it further.
- interface [IBusService](#)
A class which represents a single bus service.
- interface [IBusSolidHistoricTimeTable](#)

Used to store a historical time table record, which is an actual record for when a single bus arrive at a stop. Solid, contains only records that had actual values recorded. Any non-solid record does not necessarily contain values.

- interface [IBusStop](#)

A class which represents a single bus stop.

- interface [IBusTimeTable](#)

A class which represents a single time table record, this is a time and particular bus stop for one service.

- class [StubOperator](#)

The default operator if none is selected, this is mainly used to satisfy the null-ability requirement of C# then anything else.

Enumerations

- enum class [Direction](#) { **Inbound** , **Outbound** , **Both** }

used to state the direction of travel of a service.

- enum class [Operators](#) { **ReadingBuses** }

An enum which stores all the bus operators that the program supports.

4.2.1 Enumeration Type Documentation

4.2.1.1 Direction

```
enum Timetable\_Optimisation\_Recommendations.Bus\_Operator\_API\_Interface.Direction [strong]
```

used to state the direction of travel of a service.

4.2.1.2 Operators

```
enum Timetable\_Optimisation\_Recommendations.Bus\_Operator\_API\_Interface.Operators [strong]
```

An enum which stores all the bus operators that the program supports.

The program has been designed such that with only minimal changes any other bus operator API could be used instead with ease.

4.3 Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses Namespace Reference

Classes

- class **InternalCache**
The Internal Cache class is used to store objects of type T, into program memory this is done for the best possible performance, while also ensuring that we don't exhaust all of a devices memory.
- class **RbBusOperator**
An Implementation of the [IBusOperator](#) interface for the Reading Buses API.
- class **RbBusService**
An Implementation of the [IBusService](#) interface for the Reading Buses API.
- class **RbBusStop**
An Implementation of the [IBusStop](#) interface for the Reading Buses API.
- class **RbTimeTable**
An Implementation of the [IBusTimetable](#) interface for the Reading Buses API.
- class **RbTimeTableHistoric**
An Implementation of the [IBusHistoricTimetable](#) interface for the Reading Buses API.
- class **RbTimeTableSolidHistoric**
An Implementation of the [IBusSolidHistoricTimeTable](#) interface for the Reading Buses API.

4.4 Timetable_Optimisation_Recommendations.Pages Namespace Reference

Classes

- class **DateSelector**
The date selector page, this is where the user is asked to input a a date range, for which they intend upon making a new timetable for.
- class **Evaluator**
The actual main evaluator stage of the program, this is the GUI for the "main part". But the page mainly contains the GUI to let the user know of the progress.
- class **MainPage**
The main start page for the program, this is where the user will select the primary service that they wish to optimize for.
- class **MovesMade**
Used to display the moves that have been made by the search algorithm after it has completed and displays the finalized timetables.
- class **PreliminaryDataDownload**
The preliminary data download lets you download all of the data files that you are going to need for the search. It also lets you see the services past performance.
- class **PreviousPerformance**
Once all of the data has been downloaded in the pre-evaluator checks show the performance metrics to the user. This is the final stage before starting the actual search.
- class **RouteSegmentSelector**
The route-segment selector page finds other services that share a common route-segment with the primary service. And then allows the user to accept secondary services to also optimise their timetables for.

4.5 Timetable_Optimisation_Recommendations.Properties Namespace Reference

Classes

- class [Resources](#)
A strongly-typed resource class, for looking up localized strings, etc.
- class **Settings**

4.6 Timetable_Optimisation_Recommendations.Request_Manager Namespace Reference

Classes

- class [TimetableRetrieval](#)
Used to get a batch/ multiple-days worth of timetable data in a single query. However, this still has to be done sequentially because the Reading Buses API doesn't like having more than one database connection open at once.

4.7 Timetable_Optimisation_Recommendations.Route_Analyser Namespace Reference

Classes

- class [RouteSegment](#)
Route Segment is set of consecutive stops that two services share, the primary service, identified in the Route↔ SegmenetFinder and the secondary service that also shares it.
- class [RouteSegmentCollection](#)
The [RouteSegmentCollection](#) class manages the results of the [RouteSegmentFinder](#), and provides the logic for part of the GUI, which lets the user add or remove a service of interest.
- class [RouteSegmentFinder](#)
The route segment finder class takes in a Bus Service (known as the primary service) and a tolerance. It then finds any service which shares a common-route segment with it, to the specified minimum segment length tolerance.

4.8 Timetable_Optimisation_Recommendations.Search_Algorithm Namespace Reference

4.9 Timetable_Optimisation_Recommendations.Search_Algorithm.↔ Tabu_Search Namespace Reference

Classes

- struct [Move](#)

Used to represent a single move of the search algorithm, this involves making a change to one services timetable, on one running-board. A single timetable record is moved and then the surrounding records will also need to be edited in forwards and backwards propagation.

- class [MoveSelector](#)

The move-selector is used to select the best move out of an array of moves, the neighborhood, to generate a new solution.

- class [NeighbourhoodSolution](#)

Used to generate the neighbourhood of solutions for the search algorithm.

- class [Solution](#)

Used to represent a single solution to the problem, the actual solution is stored in a dictionary, where the service is the key and an array of timetable records is the value.

- class [TabuList](#)

[TabuList](#) keeps track of what moves are tabu/invalid and what moves can now be performed. Moves are tabu while the tabu tenure is greater than zero.

4.10 Timetable_Optimisation_Recommendations.Timetable_Analyser Namespace Reference

Classes

- class [Cluster](#)

A cluster is a selection of dates which all have the same timetable. A group is a span of consecutive days within the cluster, that all have this same timetable.

- class [Group](#)

A group is a collection of consecutive days within a cluster.

- class [TimeTableGrouper](#)

The grouper class can be used to help find patterns in the timetable where several days shared the same timetable.

4.11 Timetable_Optimisation_Recommendations.Timetable_Evaluator Namespace Reference

Classes

- class [BlamedBusTimeTable](#)

A "blamed" bus timetable is a timetable record that also contains weights and blame values, from squeaky wheel optimization. Along with the logic for updating the scheduled times.

- class [PreEvaluatorChecks](#)

Pre-evaluator checks is run before actually running the real evaluator and is used to download all of the data that is required and evaluate the performance of the old timetable.

- class [ServiceCohesionEvaluator](#)

The service cohesion evaluator works with the Evaluator class to calculate how well a services timetable works, with another service that shares a common route segment. By assigning a blame value to each timetable record based on how un-cohesive it is.

- class [SlackTimeEvaluator](#)

The slack time evaluator works with the Evaluator class to calculate if the timetable has excessive slack (Or not enough). By assigning a blame value to each timetable record based on how disruptive it is to the timetable.

- class [TimeTableEvaluator](#)

The main evaluator entry point, give it a set of dates where you want to use data from, an initial starting solution and a route-segment collection and then it can improve upon the timetable.

- class [Weights](#)

The weights class is used to store a target arrival and departure time, along with a raw and standardised weight for how much it should pull towards it.

4.12 Timetable_Optimisation_Recommendations.Timetable_↔ Performance_Evaluator Namespace Reference

Classes

- class [LatenessRecord](#)
Used to represent the lateness of one single record.
- struct [LatenessReport](#)
Used for MVVM to bind to the GUI, this contains data summerising the performance of a service.
- class [PerformanceEvaluator](#)
A class used to generate the performance of the historical/current timetables.

4.13 Timetable_Optimisation_Recommendations.Timetable_Simulator Namespace Reference

Classes

- class [DwellTimeSimulator](#)
Used to calculate how long a bus is going to need to dwell at a bus stop, given the time of day and hence changes in passenger demand. Can be considered how busy a stop is.
- class [JourneyTime](#)
A simplistic class used to help represent the journey time between two stops.
- class [JourneyTimeSimulator](#)
The journey time simulator class takes in a theoretical departure time, two stops to travel between and some other information. It then estimates how long it would likely take to travel between the two stops at this time of day.
- class [TimeSimulator](#)
Shared common code used between both the Journey Time Simulator and the Dwell Time Simulator. Manila the weighted averaging code and accuracy measures.

4.14 Timetable_Optimisation_Recommendations.UserControls Namespace Reference

Classes

- class [ClusterCard](#)
The card used to show a timetable cluster and the groupings within it.
- class [LatenessSummary](#)
The lateness summary report card, shows the performance of the service historically.
- class [NotifyTaskCompletion](#)
Helper class to wrap around a Task to provide more information usable for UI databinding scenarios. As discussed in MSDN Magazine: <https://msdn.microsoft.com/magazine/dn605875>.
- class [ServiceCard](#)
The service card, use to display the single service.

4.15 Timetable_Optimisation_Recommendations.Windows Namespace Reference

Classes

- class [Highlight](#)
Used to tell the timetable data grid what colour highlights the cells should be.
- class [MainWindow](#)
The main entry point for the application, but the logic is contained within the page.
- class [Settings](#)
The main settings page for the application.
- class [ViewTimetable](#)
Used to display the timetable to the user.
- class [ViewTimetableHighlighted](#)
Interaction logic for ViewTimetable.xaml

Chapter 5

Class Documentation

5.1 Timetable_Optimisation_Recommendations.AdvancedProgressReporting Class Reference

Advanced Progress Reporting, is used to report back to the GUI on the progress of a more complex task that contains sub-tasks.

Inheritance diagram for Timetable_Optimisation_Recommendations.AdvancedProgressReporting:

Public Member Functions

- [AdvancedProgressReporting](#) (double value, double subValue, string message)
The default constructor for the advanced reporter.
- [AdvancedProgressReporting](#) (string stage, int stageVal)
A constructor used to update the current stage message and value.
- [AdvancedProgressReporting](#) ()
The default constructor for the class.
- void [Update](#) ([AdvancedProgressReporting](#) reporter)
Used to update an advanced progress reporter with another object.
- new void [Clear](#) ()
Used to reset the progress back down to nothing/zero.

Properties

- double [SubValue](#) [get, set]
The progress of the sub value of the task.
- string? [Stage](#) [get, set]
value> The Stage integer value it is on. Total number of stages isn't specified but normally three.
- int [StageVal](#) [get, set]

Additional Inherited Members

5.1.1 Detailed Description

Advanced Progress Reporting, is used to report back to the GUI on the progress of a more complex task that contains sub-tasks.

5.1.2 Constructor & Destructor Documentation

5.1.2.1 `AdvancedProgressReporting()` [1/3]

```
Timetable_Optimisation_Recommendations.AdvancedProgressReporting.AdvancedProgressReporting (
    double value,
    double subValue,
    string message )
```

The default constructor for the advanced reporter.

Parameters

<i>value</i>	The value of the overall task.
<i>subValue</i>	The value of the sub-task.
<i>message</i>	A message to say what was last completed.

5.1.2.2 `AdvancedProgressReporting()` [2/3]

```
Timetable_Optimisation_Recommendations.AdvancedProgressReporting.AdvancedProgressReporting (
    string stage,
    int stageVal )
```

A constructor used to update the current stage message and value.

Parameters

<i>stage</i>	
<i>stageVal</i>	

5.1.2.3 `AdvancedProgressReporting()` [3/3]

```
Timetable_Optimisation_Recommendations.AdvancedProgressReporting.AdvancedProgressReporting ( )
```

The default constructor for the class.

5.1.3 Member Function Documentation

5.1.3.1 Clear()

```
new void Timetable_Optimisation_Recommendations.AdvancedProgressReporting.Clear ( )
```

Used to reset the progress back down to nothing/zero.

5.1.3.2 Update()

```
void Timetable_Optimisation_Recommendations.AdvancedProgressReporting.Update (
    AdvancedProgressReporting reporter )
```

Used to update an advanced progress reporter with another object.

Parameters

<i>reporter</i>	
-----------------	--

5.1.4 Property Documentation

5.1.4.1 SubValue

```
double Timetable_Optimisation_Recommendations.AdvancedProgressReporting.SubValue [get], [set]
```

The progress of the sub value of the task.

value>The Stage name of the task is currently on (if any)

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/AdvancedProgressReporting.cs

5.2 Timetable_Optimisation_Recommendations.App Class Reference

Interaction logic for App.xaml

Inheritance diagram for Timetable_Optimisation_Recommendations.App:

Protected Member Functions

- override async void **OnStartup** (StartupEventArgs e)

5.2.1 Detailed Description

Interaction logic for App.xaml

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/App.xaml.cs

5.3 Timetable_Optimisation_Recommendations.Timetable_Evaluator.↔ BlamedBusTimeTable Class Reference

A "blamed" bus timetable is a timetable record that also contains weights and blame values, from squeaky wheel optimization. Along with the logic for updating the scheduled times.

Inheritance diagram for Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable:

Public Member Functions

- **BlamedBusTimeTable** (IBusTimeTable record)
The default constructor for the blamed record timetable, takes in a pre-existing timetable record.
- void **SetSuggestedToReal** ()
Updates the Scheduled Arrival and Departure times to their suggested values calculated from their blame values in SWO. This should only be called on the target record.
- DateTime **ProposedSchArrivalTime** ()
Calculates the proposed scheduled arrival time. Uses the blame values and weights to suggest a new time.
- DateTime **ProposedSchDepartureTime** ()
Calculates the proposed scheduled departure time. Uses the blame values and weights to suggest a new time.
- object **Clone** ()
Performs a deep clone of the object.
- void **UpdateTimes** (DateTime arrival, DateTime departure)
Given a new arrival and departure date update it accordingly within the record.
- void **UpdateTotalWeight** ()
Generates the total weight, we do not need to apply dominance alterations here as we have already applied the dominance earlier on.
- bool **MatchDirection** (Direction direction)
Used to check if the direction of travel of this record matches the value or not.
- bool **WeakIsStopSame** (IBusTimeTable stop2)
A faster way to compare if two IBusTimeTable records are about the same bus stop. By simply comparing their string atco code, as opposed to finding and comparing the two bus stop objects.
- bool **WeakIsStopSame** (IBusStop stop2)
Used to say that if given a bus stop object is the stop about this timetable record or not.
- override bool **Equals** (object obj)
- bool **Equals** (BlamedBusTimeTable? other)
- override int **GetHashCode** ()
- string **GetId** ()
Used to get a unique ID value to represent the timetable record.

Properties

- [Weights SlackWeights](#) = new () [get]
Stores the blame values for the slack time objective.
- [Weights CohesionWeights](#) = new () [get]
value> Stores the total blame for the record as a whole.
- double [TotalWeight](#) = 0 [get]
value> Stores the Scheduled Arrival Time
- DateTime [SchArrivalTime](#) [get]
value> Stores the Scheduled Departure Time
- DateTime [SchDepartureTime](#) [get]
value> A reference is kept to the original record as lazy evaluation means it would be impractical to deep clone.
- [IBusStop Location](#) [get]
The rest of the below is your standard code for a bus timetable record.
- long **Sequence** [get]
- bool **IsOutbound** [get]
- string **JourneyCode** [get]
- string **RunningBoard** [get]
- bool **IsTimingPoint** [get]
- [IBusService Service](#) [get]

5.3.1 Detailed Description

A "blamed" bus timetable is a timetable record that also contains weights and blame values, from squeaky wheel optimization. Along with the logic for updating the scheduled times.

5.3.2 Constructor & Destructor Documentation

5.3.2.1 BlamedBusTimeTable()

```
Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable.BlamedBusTimeTable(
    IBusTimeTable record )
```

The default constructor for the blamed record timetable, takes in a pre-existing timetable record.

Parameters

<i>record</i>	The pre-existing timetable record.
---------------	------------------------------------

5.3.3 Member Function Documentation

5.3.3.1 Clone()

```
object Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable.Clone ( )
```

Performs a deep clone of the object.

Returns

A deep clone of the current object,

5.3.3.2 GetId()

```
string Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable.GetId ( )
```

Used to get a unique ID value to represent the timetable record.

Returns

A value to represent the record.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable](#).

5.3.3.3 MatchDirection()

```
bool Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable.Match↔
Direction (
    Direction direction )
```

Used to check if the direction of travel of this record matches the value or not.

Parameters

<i>direction</i>	
------------------	--

Returns

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable](#).

5.3.3.4 ProposedSchArrivalTime()

```
DateTime Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable.↔
ProposedSchArrivalTime ( )
```

Calculates the proposed scheduled arrival time. Uses the blame values and weights to suggest a new time.

Returns

The best new arrival time for this record

5.3.3.5 ProposedSchDepartureTime()

```
DateTime Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable.ProposedSchDepartureTime ( )
```

Calculates the proposed scheduled departure time. Uses the blame values and weights to suggest a new time.

Returns

The best new departure time for this record.

5.3.3.6 SetSuggestedToReal()

```
void Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable.SetSuggestedToReal ( )
```

Updates the Scheduled Arrival and Departure times to their suggested values calculated from their blame values in SWO. This should only be called on the target record.

5.3.3.7 UpdateTimes()

```
void Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable.UpdateTimes (
    DateTime arrival,
    DateTime departure )
```

Given a new arrival and departure date update it accordingly within the record.

Parameters

<i>arrival</i>	new arrival time.
<i>departure</i>	new departure time.

5.3.3.8 UpdateTotalWeight()

```
void Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable.UpdateTotalWeight ( )
```

Generates the total weight, we do not need to apply dominance alterations here as we have already applied the dominance earlier on.

This is the normalized weights added together.

5.3.3.9 WeakIsStopSame() [1/2]

```
bool Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable.WeakIs↔
StopSame (
    IBusStop stop2 )
```

Used to say that if given a bus stop object is the stop about this timetable record or not.

Parameters

<i>stop2</i>	
--------------	--

Returns

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable](#).

5.3.3.10 WeakIsStopSame() [2/2]

```
bool Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable.WeakIs↔
StopSame (
    IBusTimeTable stop2 )
```

A faster way to compare if two IBusTimeTable records are about the same bus stop. By simply comparing their string atco code, as opposed to finding and comparing the two bus stop objects.

Parameters

<i>stop2</i>	Another time table record to compare against.
--------------	---

Returns

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable](#).

5.3.4 Property Documentation

5.3.4.1 Location

```
IBusStop Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable.Location [get]
```

The rest of the below is your standard code for a bus timetable record.

5.3.4.2 SlackWeights

```
Weights Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable.SlackWeights = new () [get]
```

Stores the blame values for the slack time objective.

value>Stores the blame values for the cohesion objective.

The documentation for this class was generated from the following file:

- Timetable_Optimisation_Recommendations/Timetable_Optimisation_Recommendations/Timetable_Evaluator/BlamedBusTimeTable.cs

5.4 Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusOperatorFactory Class Reference

A singleton factory object, that can produce and return back the current [IBusOperator](#) object. This allows for support of several bus operators, not just Reading Buses. You would set the operator you want to get data for and the factory will then return a singleton reference to the operator object.

Public Member Functions

- async Task [SetOperatorAsync](#) ([Operators](#) selected)
Used to switch between operators to return.

Properties

- static [BusOperatorFactory Instance](#) [get]
Used to request an instance to the singleton object.
- [IBusOperator Operator](#) = new [StubOperator](#)() [get]
Stores the object reference for the current operator.

5.4.1 Detailed Description

A singleton factory object, that can produce and return back the current [IBusOperator](#) object. This allows for support of several bus operators, not just Reading Buses. You would set the operator you want to get data for and the factory will then return a singleton reference to the operator object.

5.4.2 Member Function Documentation

5.4.2.1 SetOperatorAsync()

```
async Task Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusOperator↔
Factory.SetOperatorAsync (
    Operators selected )
```

Used to switch between operators to return.

Parameters

<i>selected</i>	The bus operator to return
-----------------	----------------------------

Returns

Nothing, signifies once completed.

5.4.3 Property Documentation

5.4.3.1 Instance

```
BusOperatorFactory Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.Bus↔
OperatorFactory.Instance [static], [get]
```

Used to request an instance to the singleton object.

5.4.3.2 Operator

```
IBusOperator Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusOperator↔
Factory.Operator = new StubOperator() [get]
```

Stores the object reference for the current operator.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Bus Operator API Interface/BusOperatorFactory.cs

5.5 Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusTimeTableStub Class Reference

Used when you need to problematically make a new `IBusTimetable` record, for example when you are making a new timetable during the evaluator.

Inheritance diagram for `Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusTimeTableStub`:

Public Member Functions

- **BusTimeTableStub** (`IBusTimeTable` timeTable)
- bool **MatchDirection** (`Direction` direction)
Used to check if the direction of travel of this record matches the value or not.
- **BusTimeTableStub** (`IBusTimeTable` timeTable, `TimeSpan` schArrivalTime, `TimeSpan` schDepartureTime)
- bool **WeakIsStopSame** (`IBusTimeTable` stop2)
A faster way to compare if two `IBusTimeTable` records are about the same bus stop. By simply comparing their string `atco` code, as opposed to finding and comparing the two bus stop objects.
- bool **WeakIsStopSame** (`IBusStop` stop2)
Used to say that if given a bus stop object is the stop about this timetable record or not.
- string **GetId** ()
Used to get a unique ID value to represent the timetable record.

Properties

- long **Sequence** [get, protected set]
- bool **IsOutbound** [get, protected set]
- string **JourneyCode** [get, protected set]
- bool **IsTimingPoint** [get, protected set]
- DateTime **SchArrivalTime** [get, set]
- DateTime **SchDepartureTime** [get, set]
- string **Serviceld** [get, set]
- string **StopId** [get, set]
- string **RunningBoard** [get, set]
- `IBusStop` **Location** [get]
- `IBusService` **Service** [get]

5.5.1 Detailed Description

Used when you need to problematically make a new `IBusTimetable` record, for example when you are making a new timetable during the evaluator.

5.5.2 Member Function Documentation

5.5.2.1 GetId()

```
string Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusTimeTableStub.↔
GetId ( )
```

Used to get a unique ID value to represent the timetable record.

Returns

A value to represent the record.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable](#).

5.5.2.2 MatchDirection()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusTimeTableStub.↔
MatchDirection (
    Direction direction )
```

Used to check if the direction of travel of this record matches the value or not.

Parameters

<i>direction</i>	
------------------	--

Returns

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable](#).

5.5.2.3 WeakIsStopSame() [1/2]

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusTimeTableStub.Weak↔
IsStopSame (
    IBusStop stop2 )
```

Used to say that if given a bus stop object is the stop about this timetable record or not.

Parameters

<i>stop2</i>	
--------------	--

Returns

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable](#).

5.5.2.4 WeakIsStopSame() [2/2]

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusTimeTableStub.WeakIsStopSame (
    IBusTimeTable stop2 )
```

A faster way to compare if two [IBusTimeTable](#) records are about the same bus stop. By simply comparing their string atco code, as opposed to finding and comparing the two bus stop objects.

Parameters

<i>stop2</i>	Another time table record to compare against.
--------------	---

Returns

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable](#).

The documentation for this class was generated from the following file:

- Timetable_Optimisation_Recommendations/Timetable_Optimisation_Recommendations/Bus_Operator_API_Interface/BusTimeTableStub.cs

5.6 Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.CacheWriter Class Reference

Used to write a cache files to the disk.

Static Public Member Functions

- static void [WriteToCache](#) (string fileLoc, string fileName, string? content)
Saves a cache file to local disk, and hides the folder so the user cannot see it.

5.6.1 Detailed Description

Used to write a cache files to the disk.

5.6.2 Member Function Documentation

5.6.2.1 WriteToCache()

```
static void Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.CacheWriter.↔
WriteToCache (
    string fileLoc,
    string fileName,
    string? content ) [static]
```

Saves a cache file to local disk, and hides the folder so the user cannot see it.

Parameters

<i>fileLoc</i>	The location for the cache file.
<i>fileName</i>	The name of the file
<i>content</i>	The contents of the file.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Bus Operator API Interface/CacheWriter.cs

5.7 Timetable_Optimisation_Recommendations.Timetable_Analyser.↔ Cluster Class Reference

A cluster is a selection of dates which all have the same timetable. A group is a span of consecutive days within the cluster, that all have this same timetable.

Public Member Functions

- [Cluster](#) (DateTime date, [IBusTimeTable](#)[] timeTable)
The default constructor for the cluster. Given one date for each the timetable applies and then the timetable associated.
- void [AddDate](#) (DateTime date)
Used to associate another date with the cluster.
- void [CalculateGrouping](#) ()
Builds up the groups from the cluster.
- [IBusService](#) [GetAssociatedService](#) ()
Gets the associated service for the cluster.

Properties

- List< DateTime > [AssociatedTimes](#) [get]
A list of dates which are associated with this timetable, i.e they had the same timetable as each other.
- [IBusTimeTable\[\]](#) [BusTimeTables](#) [get]
The timetable for this cluster, an array of records for one day.
- [Group?](#) [GroupingAssociated](#) [get]
The Grouping associated with the cluster.
- int [ClusterId](#) [get]
A unique ID for the cluster.

5.7.1 Detailed Description

A cluster is a selection of dates which all have the same timetable. A group is a span of consecutive days within the cluster, that all have this same timetable.

5.7.2 Constructor & Destructor Documentation

5.7.2.1 Cluster()

```
Timetable_Optimisation_Recommendations.Timetable_Analyser.Cluster.Cluster (
    DateTime date,
    IBusTimeTable[] timeTable )
```

The default constructor for the cluster. Given one date for each the timetable applies and then the timetable associated.

Parameters

<i>date</i>	A date associated with the timetable.
<i>timeTable</i>	The timetable it self.

5.7.3 Member Function Documentation

5.7.3.1 AddDate()

```
void Timetable_Optimisation_Recommendations.Timetable_Analyser.Cluster.AddDate (
    DateTime date )
```

Used to associate another date with the cluster.

Parameters

<i>date</i>	A new date to add to the cluster.
-------------	-----------------------------------

5.7.3.2 CalculateGrouping()

```
void Timetable_Optimisation_Recommendations.Timetable_Analyser.Cluster.CalculateGrouping ( )
```

Builds up the groups from the cluster.

5.7.3.3 GetAssociatedService()

```
IBusService Timetable_Optimisation_Recommendations.Timetable_Analyser.Cluster.GetAssociated↔  
Service ( )
```

Gets the associated service for the cluster.

Returns

5.7.4 Property Documentation

5.7.4.1 AssociatedTimes

```
List<DateTime> Timetable_Optimisation_Recommendations.Timetable_Analyser.Cluster.Associated↔  
Times [get]
```

A list of dates which are associated with this timetable, i.e they had the same timetable as each other.

5.7.4.2 BusTimeTables

```
IBusTimeTable [ ] Timetable_Optimisation_Recommendations.Timetable_Analyser.Cluster.BusTime↔  
Tables [get]
```

The timetable for this cluster, an array of records for one day.

5.7.4.3 ClusterId

```
int Timetable_Optimisation_Recommendations.Timetable_Analyser.Cluster.ClusterId [get]
```

A unique ID for the cluster.

5.7.4.4 GroupingAssociated

```
Group? Timetable_Optimisation_Recommendations.Timetable_Analyser.Cluster.GroupingAssociated  
[get]
```

The Grouping associated with the cluster.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Timetable Analyser/Cluster.↵
cs

5.8 Timetable_Optimisation_Recommendations.UserControls.Cluster↵ Card Class Reference

The card used to show a timetable cluster and the groupings within it.

Inheritance diagram for Timetable_Optimisation_Recommendations.UserControls.ClusterCard:

Public Member Functions

- [ClusterCard](#) ()
The default constructor.

5.8.1 Detailed Description

The card used to show a timetable cluster and the groupings within it.

5.8.2 Constructor & Destructor Documentation

5.8.2.1 ClusterCard()

`Timetable_Optimisation_Recommendations.UserControls.ClusterCard.ClusterCard ()`

The default constructor.

The documentation for this class was generated from the following file:

- `Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/UserControls/ClusterCard.xaml.cs`

5.9 Timetable_Optimisation_Recommendations.Pages.DateSelector Class Reference

The date selector page, this is where the user is asked to input a a date range, for which they intend upon making a new timetable for.

Inheritance diagram for `Timetable_Optimisation_Recommendations.Pages.DateSelector`:

Public Member Functions

- [DateSelector](#) (string serviceId)
The default constructor, takes in a service ID string and then creates the date selector for that service.

Properties

- `DateTime` [StartDate](#) = `DateTime.Today` [get, set]
The Start date for which they wish to get timetable data for.
- `DateTime` [EndDate](#) = `DateTime.Today` [get, set]
value> The service for which they are finding timetables groups for.
- `IBusService` [Service](#) [get]
value> Used to store when different timetables were in affect.
- `ObservableCollection< Cluster >` [TimeTableClusters](#) = `new()` [get]
value> Used to update the GUI progress bar.
- `ProgressReporting` [Reporter](#) = `new()` [get]

5.9.1 Detailed Description

The date selector page, this is where the user is asked to input a a date range, for which they intend upon making a new timetable for.

5.9.2 Constructor & Destructor Documentation

5.9.2.1 DateSelector()

```
Timetable_Optimisation_Recommendations.Pages.DateSelector.DateSelector (
    string serviceId )
```

The default constructor, takes in a service ID string and then creates the date selector for that service.

Parameters

<i>serviceId</i>	
<i>Id</i>	

5.9.3 Property Documentation

5.9.3.1 StartDate

```
DateTime Timetable_Optimisation_Recommendations.Pages.DateSelector.StartDate = DateTime.Today
[get], [set]
```

The Start date for which they wish to get timetable data for.

value>The end date for which they wish to get timetable data for.

The documentation for this class was generated from the following file:

- Timetable_Optimisation_Recommendations/Timetable_Optimisation_Recommendations/Pages/DateSelector.xaml.cs

5.10 Timetable_Optimisation_Recommendations.Timetable_Analyser.Group.DateSpan Class Reference

A class used to represent a date span, which is a period between two dates.

Public Member Functions

- [DateSpan](#) (DateTime start, DateTime end)
A default constructor, which takes in an initial start and end date for the date span.
- [DateSpan](#) (DateTime start)
As the start and end initial values are likely to be the same. Until new data can be found, this constructor sets both to be the same.
- int [TotalSpan](#) ()
How long the span is, 0 for one day.
- void [AddDate](#) (DateTime date)
Adds a new date to the date span, this date must be one newer or one day older than the current span. A span must be consecutive, so you cannot adjust the start or end span several days off the previous known cluster.
- bool [IsWeekDay](#) ()
Returns if the date-span is only contained within a weekday (Monday to Friday) Or if it contains weekends as well. This is because I'm assuming weekdays will have generally contestant timetables.
- override string [ToString](#) ()
The string representation of the group.

Properties

- DateTime [Start](#) [get]
The start date of the span, this should be the oldest of the dates.
- DateTime [End](#) [get]
The end date of the span, this should be the newest of the dates.

5.10.1 Detailed Description

A class used to represent a date span, which is a period between two dates.

5.10.2 Constructor & Destructor Documentation

5.10.2.1 [DateSpan\(\)](#) [1/2]

```
Timetable_Optimisation_Recommendations.Timetable_Analyser.Group.DateSpan.DateSpan (
    DateTime start,
    DateTime end )
```

A default constructor, which takes in an initial start and end date for the date span.

Parameters

<i>start</i>	An starting value for the date span.
<i>end</i>	An ending value for the date span.

5.10.2.2 DateSpan() [2/2]

```
Timetable_Optimisation_Recommendations.Timetable_Analyser.Group.DateSpan.DateSpan (
    DateTime start )
```

As the start and end initial values are likely to be the same. Until new data can be found, this constructor sets both to be the same.

Parameters

<i>start</i>	The start and end date for the date span
--------------	--

5.10.3 Member Function Documentation

5.10.3.1 AddDate()

```
void Timetable_Optimisation_Recommendations.Timetable_Analyser.Group.DateSpan.AddDate (
    DateTime date )
```

Adds a new date to the date span, this date must be one newer or one day older than the current span. A span must be consecutive, so you cannot adjust the start or end span several days off the previous known cluster.

Parameters

<i>date</i>	A new start or end date for the span.
-------------	---------------------------------------

5.10.3.2 IsWeekDay()

```
bool Timetable_Optimisation_Recommendations.Timetable_Analyser.Group.DateSpan.IsWeekDay ( )
```

Returns if the date-span is only contained within a weekday (Monday to Friday) Or if it contains weekends as well. This is because I'm assuming weekdays will have generally contestant timetables.

Returns

5.10.3.3 ToString()

```
override string Timetable_Optimisation_Recommendations.Timetable_Analyser.Group.DateSpan.To←  
String ( )
```

The string representation of the group.

Returns

5.10.3.4 TotalSpan()

```
int Timetable_Optimisation_Recommendations.Timetable_Analyser.Group.DateSpan.TotalSpan ( )
```

How long the span is, 0 for one day.

Returns

How long the date span is.

5.10.4 Property Documentation

5.10.4.1 End

```
DateTime Timetable_Optimisation_Recommendations.Timetable_Analyser.Group.DateSpan.End [get]
```

The end date of the span, this should be the newest of the dates.

5.10.4.2 Start

```
DateTime Timetable_Optimisation_Recommendations.Timetable_Analyser.Group.DateSpan.Start [get]
```

The start date of the span, this should be the oldest of the dates.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Timetable Analyser/Group.←
cs

5.11 Timetable_Optimisation_Recommendations.Timetable_Simulator.DwellTimeSimulator Class Reference

Used to calculate how long a bus is going to need to dwell at a bus stop, given the time of day and hence changes in passenger demand. Can be considered how busy a stop is.

Inheritance diagram for Timetable_Optimisation_Recommendations.Timetable_Simulator.DwellTimeSimulator:

Public Member Functions

- [DwellTimeSimulator](#) (DateTime[] cluster, [IBusStop](#) busStop, TimeSpan time, [IBusService](#)[] services)
The default constructor for the class.
- async Task< TimeSpan > [ProduceEstimatedDwell](#) (IProgress< double >? progress)
Actually generates the time that is estimated for the bus to dwell at the stop.

Additional Inherited Members

5.11.1 Detailed Description

Used to calculate how long a bus is going to need to dwell at a bus stop, given the time of day and hence changes in passenger demand. Can be considered how busy a stop is.

5.11.2 Constructor & Destructor Documentation

5.11.2.1 DwellTimeSimulator()

```
Timetable_Optimisation_Recommendations.Timetable_Simulator.DwellTimeSimulator.DwellTime←
Simulator (
    DateTime[] cluster,
    IBusStop busStop,
    TimeSpan time,
    IBusService[] services )
```

The default constructor for the class.

Parameters

<i>cluster</i>	Dates for which we can request data from
<i>busStop</i>	The bus stop in question to get dwell time for
<i>time</i>	The time a bus is meant to arrive at the stop
<i>services</i>	What bus services stopping at the stop were interested in

5.11.3 Member Function Documentation

5.11.3.1 ProduceEstimatedDwell()

```
async Task<TimeSpan> Timetable_Optimisation_Recommendations.Timetable_Simulator.DwellTime↵
Simulator.ProduceEstimatedDwell (
    IProgress< double >? progress )
```

Actually generates the time that is estimated for the bus to dwell at the stop.

Parameters

<i>progress</i>	Progress bar used to update the GUI on the progress of the task.
-----------------	--

Returns

Given the starting parameters the final outputted dwell time estimate.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Timetable Simulator/Dwell↵ TimeSimulator.cs

5.12 Timetable_Optimisation_Recommendations.Pages.Evaluator Class Reference

The actual main evaluator stage of the program, this is the GUI for the "main part". But the page mainly contains the GUI to let the user know of the progress.

Inheritance diagram for Timetable_Optimisation_Recommendations.Pages.Evaluator:

Public Member Functions

- [Evaluator](#) ([PreEvaluatorChecks](#) preEvaluator)
The default evaluator constructor, takes in the information from the pre-evaluator.

Properties

- [AdvancedProgressReporting Reporter](#) = new() [get]
Used to report back to GUI the process progress.

5.12.1 Detailed Description

The actual main evaluator stage of the program, this is the GUI for the "main part". But the page mainly contains the GUI to let the user know of the progress.

5.12.2 Constructor & Destructor Documentation

5.12.2.1 Evaluator()

```
Timetable_Optimisation_Recommendations.Pages.Evaluator.Evaluator (
    PreEvaluatorChecks preEvaluator )
```

The default evaluator constructor, takes in the information from the pre-evaluator.

Parameters

<i>preEvaluator</i>	The pre-evaluator object
---------------------	--------------------------

5.12.3 Property Documentation

5.12.3.1 Reporter

```
AdvancedProgressReporting Timetable_Optimisation_Recommendations.Pages.Evaluator.Reporter =
new() [get]
```

Used to report back to GUI the process progress.

value>Contains the actual logic and implementation of the evaluator.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Pages/Evaluator.↵
xaml.cs

5.13 Timetable_Optimisation_Recommendations.Timetable_Analyser.↵ Group Class Reference

A group is a collection of consecutive days within a cluster.

Classes

- class [DateSpan](#)

A class used to represent a date span, which is a period between two dates.

Public Member Functions

- [Group](#) ([List](#)< [DateTime](#) > associatedTimes)
The default constructor for the group.
- [List](#)< [DateSpan](#) > [GroupingsOfClusters](#) ([List](#)< [DateTime](#) > associatedTimes)
Generates a grouping within the cluster. A group is a set of consecutive days which share the same timetable. This finds all the groups within the cluster and adds it to a list. A group can be one single day.
- [async Task](#)< string > [GetStringAsync](#) ([List](#)< [DateTime](#) > associatedTimes)
Generates the string for the GUI to output.

Properties

- [List](#)< [DateSpan](#) >? [Grouping](#) [get]
A list of date spans, which contains the groups where times were the same.
- [NotifyTaskCompletion](#)< string > [List](#) [get]
value> Contains the GUI grouping representation.

5.13.1 Detailed Description

A group is a collection of consecutive days within a cluster.

5.13.2 Constructor & Destructor Documentation

5.13.2.1 Group()

```
Timetable_Optimisation_Recommendations.Timetable_Analyser.Group.Group (
    List< DateTime > associatedTimes )
```

The default constructor for the group.

Parameters

<i>associatedTimes</i>	Takes in just a list of date times to group.
------------------------	--

5.13.3 Member Function Documentation

5.13.3.1 GetStringAsync()

```
async Task<string> Timetable_Optimisation_Recommendations.Timetable_Analyser.Group.GetStringAsync (
    List< DateTime > associatedTimes )
```

Generates the string for the GUI to output.

Parameters

<i>associatedTimes</i>	A list of date times to group.
------------------------	--------------------------------

Returns

A string summarizing the groups that have been found.

5.13.3.2 GroupingsOfClusters()

```
List<DateSpan> Timetable_Optimisation_Recommendations.Timetable_Analyser.Group.GroupingsOfClusters (
    List< DateTime > associatedTimes )
```

Generates a grouping within the cluster. A group is a set of consecutive days which share the same timetable. This finds all the groups within the cluster and adds it to a list. A group can be one single day.

Returns

Groupings within a cluster.

5.13.4 Property Documentation

5.13.4.1 Grouping

```
List<DateSpan>? Timetable_Optimisation_Recommendations.Timetable_Analyser.Group.Grouping
[get]
```

A list of date spans, which contains the groups where times were the same.

value>Used by the GUI to know the groups and how/when to update.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Timetable Analyser/Group.cs

5.14 Timetable_Optimisation_Recommendations.Windows.Highlight Class Reference

Used to tell the timetable data grid what colour highlights the cells should be.

Properties

- int **X** [get]
The X coordinate in the grid.
- int **Y** [get]
value>Is it for the outbound or inbound table.
- bool **IsOutbound** [get]
value>The total weighting cell colour.
- SolidColorBrush **TotalWeight** = Brushes.Green [get]
value>The slack time cell colour
- SolidColorBrush **SlackWeight** = Brushes.Green [get]
value>The cohesion value cell colour
- SolidColorBrush **CohesionWeight** = Brushes.Green [get]
value>If it's a moved record or not cell colour.
- SolidColorBrush **MoveHighlight** = new SolidColorBrush(Color.FromArgb(0, 255, 255, 255)) [get, set]

5.14.1 Detailed Description

Used to tell the timetable data grid what colour highlights the cells should be.

5.14.2 Property Documentation

5.14.2.1 X

```
int Timetable_Optimisation_Recommendations.Windows.Highlight.X [get]
```

The X coordinate in the grid.

value>The Y coordinate in the grid.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Windows/Highlight.cs

5.15 Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusHistoricTimeTable Interface Reference

Used to store a historical time table record, which is an actual record for when a single bus arrive at a stop.

Inheritance diagram for Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusHistoricTimeTable:

Public Member Functions

- bool [CouldBeSolid](#) ()
Returns if the record could be made a "solid" record or not. A solid record is one with reported arrival and departure times.
- [IBusSolidHistoricTimeTable GetSolid](#) ()
Gets the solid representation of the same object.

Properties

- DateTime? [ActArrivalTime](#) [get]
The actual arrival time for the bus.
- DateTime? [ActDepartureTime](#) [get]
The actual departure time for the bus.

5.15.1 Detailed Description

Used to store a historical time table record, which is an actual record for when a single bus arrive at a stop.

5.15.2 Member Function Documentation

5.15.2.1 CouldBeSolid()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusHistoricTimeTable.CouldBeSolid ( )
```

Returns if the record could be made a "solid" record or not. A solid record is one with reported arrival and departure times.

Returns

true if Actual Arrival and Departure have values.

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbTimeTableHistoric](#).

5.15.2.2 GetSolid()

```
IBusSolidHistoricTimeTable Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.↔
IBusHistoricTimeTable.GetSolid ( )
```

Gets the solid representation of the same object.

Returns

Gets the solid equivalence object.

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbTimeTableHistoric](#).

The documentation for this interface was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Bus Operator API Interface/IBusHistoricTimeTable.cs

5.16 Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator Interface Reference ↔

Provides all the information about a bus operator and gives the ability to query it further.

Inheritance diagram for Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator:

Public Member Functions

- [IBusService.GetService](#) (string serviceNumber)
Returns a service which matches the Service Number passed.
- bool [IsService](#) (string serviceNumber)
Checks to see if a service of that number exists or not in the API feed.
- [IBusService\[\] GetServices](#) ()
Gets an array of all the IBusServices Objects.
- [IBusStop GetLocation](#) (string atcoCode)
Get a bus stop location based upon a bus stops location code
- bool [IsLocation](#) (string atcoCode)
Checks to see if the atco code for the bus stop exists in the API feed or not.
- void [InvalidateCache](#) ()
Deletes any Cache data stored, use this only if you need to force new data cache.
- void [ForceUpdateCache](#) ()
Forces the current data stored in the bus operator object to be saved into Cache. You would need to do this if you've made some lazy API requests.

5.16.1 Detailed Description

Provides all the information about a bus operator and gives the ability to query it further.

5.16.2 Member Function Documentation

5.16.2.1 ForceUpdateCache()

```
void Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator.Force↔  
UpdateCache ( )
```

Forces the current data stored in the bus operator object to be saved into Cache. You would need to do this if you've made some lazy API requests.

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator](#), and [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusOperator](#).

5.16.2.2 GetLocation()

```
IBusStop Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator.Get↔  
Location (   
    string atcoCode )
```

Get a bus stop location based upon a bus stops location code

Parameters

<i>atcoCode</i>	The code of the bus stop
-----------------	--------------------------

Returns

A Bus Stop object for the Atco Code specified.

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator](#), and [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusOperator](#).

5.16.2.3 GetService()

```
IBusService Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator.↔  
GetService (   
    string serviceNumber )
```

Returns a service which matches the Service Number passed.

Parameters

<i>serviceNumber</i>	The service number/ID for the service you wish to be returned eg: 17 or 22.
----------------------	---

Returns

The services matching the ID.

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator](#), and [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusOperator](#).

5.16.2.4 GetServices()

```
IBusService [ ] Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator.GetServices ( )
```

Gets an array of all the IBusServices Objects.

Returns

An array of all the bus services.

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator](#), and [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusOperator](#).

5.16.2.5 InvalidateCache()

```
void Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator.InvalidateCache ( )
```

Deletes any Cache data stored, use this only if you need to force new data cache.

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator](#), and [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusOperator](#).

5.16.2.6 IsLocation()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator.IsLocation (
    string atcoCode )
```

Checks to see if the atco code for the bus stop exists in the API feed or not.

Parameters

<i>atcoCode</i>	The ID Code for a bus stop.
-----------------	-----------------------------

Returns

True or False depending on if the stop is in the API feed or not.

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusOperator](#), and [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator](#).

5.16.2.7 IsService()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator.IsService
(
    string serviceNumber )
```

Checks to see if a service of that number exists or not in the API feed.

Parameters

<i>serviceNumber</i>	The service number to find.
----------------------	-----------------------------

Returns

True or False for if a service is the API feed or not.

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator](#), and [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusOperator](#).

The documentation for this interface was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Bus Operator API Interface/IBusOperator.cs

5.17 Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusService Interface Reference

A class which represents a single bus service.

Inheritance diagram for Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusService:

Public Member Functions

- Task< [IBusStop\[\]](#)> [GetLocations](#) ([Direction](#) direction=[Direction.Both](#))
Gets an array of 'BusStop' objects the bus service travels too as an array of [BusStop](#) objects. If the API is invalid and links to a [Bus Stop](#) not in the list of locations it will simply be ignored.
- Task< [IBusTimeTable\[\]](#)> [GetTimeTable](#) ([DateTime](#) date)
Gets the planned timetable departure and arrival times for this service on a specific date.
- bool [IsTimeTableCached](#) ([DateTime](#) date)
Tells you if a file has been cached or not on disk.
- Task< [IBusHistoricTimeTable\[\]](#)> [GetArchivedTimeTable](#) ([DateTime](#) date)
Gets the archived real bus departure and arrival times along with their time table history for this service on a specific date.
- bool [IsArchivedTimeTableCached](#) ([DateTime](#) date)
Tells you if a file has been cached or not on disk.
- bool [IsWeakServiceSame](#) ([IBusService](#) service)
Given another [IBusService](#) Object, check if it is the same service or not. Only by comparing the service ID value.

Properties

- string [ServiceId](#) [get]

5.17.1 Detailed Description

A class which represents a single bus service.

5.17.2 Member Function Documentation

5.17.2.1 GetArchivedTimeTable()

```
Task<IBusHistoricTimeTable\[\]> Timetable\_Optimisation\_Recommendations.Bus\_Operator\_API\_↔
Interface.IBusService.GetArchivedTimeTable (
    DateTime date )
```

Gets the archived real bus departure and arrival times along with their time table history for this service on a specific date.

Parameters

<i>date</i>	the date on which you want a archived timetable data for. This should be a date in the past.
-------------	--

Returns

An array of time table records, containing the scheduled and actual arrival and departure times of buses.

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusService](#).

5.17.2.2 GetLocations()

```
Task<IBusStop[]> Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusService.GetLocations (
    Direction direction = Direction.Both )
```

Gets an array of 'BusStop' objects the bus service travels too as an array of BusStop objects. If the API is invalid and links to a Bus Stop not in the list of locations it will simply be ignored.

Parameters

<i>direction</i>	Used to filter by the direction of travel the stops are on.
------------------	---

Returns

An array of BusStop objects for the stops visited by this service.

It is assumed that the ordering of the array is the ordering in which a service will visit all of the stops. If the ordering is incorrect the route-segment finder will fail.

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusService](#).

5.17.2.3 GetTimeTable()

```
Task<IBusTimeTable[]?> Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusService.GetTimeTable (
    DateTime date )
```

Gets the planned timetable departure and arrival times for this service on a specific date.

Parameters

<i>date</i>	the date on which you want a archived timetable data for. This should be a date in the past.
-------------	--

Returns

An array of time table records, containing the planned scheduled and actual arrival and departure times of buses.

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusService](#).

5.17.2.4 IsArchivedTimeTableCached()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusService.IsArchivedTimeTableCached (
    DateTime date )
```

Tells you if a file has been cached or not on disk.

Parameters

<i>date</i>	The date for the time table date to search for.
-------------	---

Returns

True if the data is cached on disk

[GetArchivedTimeTable\(DateTime\)](#)

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusService](#).

5.17.2.5 IsTimeTableCached()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusService.IsTime↵
TableCached (
    DateTime date )
```

Tells you if a file has been cached or not on disk.

Parameters

<i>date</i>	The date for the time table date to search for.
-------------	---

Returns

True if the data is cached on disk

[GetTimeTable\(DateTime\)](#)

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusService](#).

5.17.2.6 IsWeakServiceSame()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusService.IsWeak↵
ServiceSame (
    IBusService service )
```

Given another [IBusService](#) Object, check if it is the same service or not. Only by comparing the service ID value.

Parameters

<i>service</i>	The other service you wish to compare against.
----------------	--

Returns

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusService](#).

5.17.3 Property Documentation

5.17.3.1 ServiceId

```
string Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusService.ServiceId
[get]
```

The unique alphanumeric identifier for a bus service.

The documentation for this interface was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Bus Operator API Interface/IBusService.cs

5.18 Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusSolidHistoricTimeTable Interface Reference

Used to store a historical time table record, which is an actual record for when a single bus arrive at a stop. Solid, contains only records that had actual values recorded. Any non-solid record does not necessarily contain values.

Inheritance diagram for [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusSolidHistoricTimeTable](#):

Properties

- DateTime [ActArrivalTime](#) [get]
The actual arrival time for the bus.
- DateTime [ActDepartureTime](#) [get]
The actual departure time for the bus.

Additional Inherited Members

5.18.1 Detailed Description

Used to store a historical time table record, which is an actual record for when a single bus arrive at a stop. Solid, contains only records that had actual values recorded. Any non-solid record does not necessarily contain values.

The documentation for this interface was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Bus Operator API Interface/IBusSolidHistoricTimeTable.cs

5.19 Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusStop Interface Reference

A class which represents a single bus stop.

Inheritance diagram for Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusStop:

Public Member Functions

- [IBusService\[\] GetServices \(\)](#)
Finds the 'BusService' object for all of the bus services which visit this stop.
- [Task< IBusHistoricTimeTable\[\]?> GetArchivedTimeTable \(DateTime date\)](#)
Gets the archived real bus departure and arrival times along with their time table history at this specific bus stop.
- [bool IsArchivedTimeTableCached \(DateTime date\)](#)
Tells you if a file has been cached or not on disk.
- [Task< IBusHistoricTimeTable\[\]?> GetWeakArchivedTimeTable \(DateTime date\)](#)
Get "Weak" archived timetable doesn't actually call-upon the API feed. It will look at the cached data on disk, finding services that visit the stop, ask for all their timetables and then filter out all the records that are not about this stop. This means that you might end up missing out on some data if you've not cached the service. However it will be significantly faster than actually calling upon the API feed.

Properties

- [string AtcoCode](#) [get]
The unique identifier for a bus stop.
- [string CommonName](#) [get]
The public, easy to understand stop name.
- [string Latitude](#) [get]
The latitude of the bus stop
- [string Longitude](#) [get]
The longitude of the bus stop
- [string Bearing](#) [get]
The bearing of the bus stop
- [string?\[\] Services](#) [get]
A list of the IDs of the services which stop at this stop.

5.19.1 Detailed Description

A class which represents a single bus stop.

5.19.2 Member Function Documentation

5.19.2.1 GetArchivedTimeTable()

```
Task<IBusHistoricTimeTable[ ]?> Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusStop.GetArchivedTimeTable (
    DateTime date )
```

Gets the archived real bus departure and arrival times along with their time table history at this specific bus stop.

Parameters

<i>date</i>	The date you want time table data for. This should be a date in the past.
-------------	---

Returns

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusStop](#).

5.19.2.2 GetServices()

```
IBusService [ ] Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusStop.
GetServices ( )
```

Finds the 'BusService' object for all of the bus services which visit this stop.

Returns

A list of BusService Objects for services which visit this bus stop.

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusStop](#).

5.19.2.3 GetWeakArchivedTimeTable()

```
Task<IBusHistoricTimeTable[ ]?> Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusStop.GetWeakArchivedTimeTable (
    DateTime date )
```

Get "Weak" archived timetable doesn't actually call-upon the API feed. It will look at the cached data on disk, finding services that visit the stop, ask for all their timetables and then filter out all the records that are not about this stop. This means that you might end up missing out on some data if you've not cached the service. However it will be significantly faster than actually calling upon the API feed.

Parameters

<i>date</i>	The date to get stop timetable data from.
-------------	---

Returns

Timetable data for the stop, made up of any cache data about it.

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusStop](#).

5.19.2.4 IsArchivedTimeTableCached()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusStop.IsArchived↔
TimeTableCached (
    DateTime date )
```

Tells you if a file has been cached or not on disk.

Parameters

<i>date</i>	The date for the time table date to search for.
-------------	---

Returns

True if the data is cached on disk

[GetArchivedTimeTable\(DateTime\)](#)

Implemented in [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusStop](#).

The documentation for this interface was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Bus Operator API Interface/IBusStop.cs

5.20 [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable](#)↔ Interface Reference

A class which represents a single time table record, this is a time and particular bus stop for one service.

Inheritance diagram for [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable](#)↔ Table:

Public Member Functions

- bool [WeakIsStopSame](#) (IBusTimeTable stop2)
A faster way to compare if two [IBusTimeTable](#) records are about the same bus stop. By simply comparing their string atco code, as opposed to finding and comparing the two bus stop objects.
- bool [WeakIsStopSame](#) (IBusStop stop2)
Used to say that if given a bus stop object is the stop about this timetable record or not.
- string [GetId](#) ()
Used to get a unique ID value to represent the timetable record.
- bool [MatchDirection](#) (Direction direction)
Used to check if the direction of travel of this record matches the value or not.

Properties

- [IBusStop Location](#) [get]
The 'BusStop' object for the stop relating to the time table record..
- long [Sequence](#) [get]
What number bus stop is this in the buses route, ie 1, is the first stop to visit.
- Boolean [IsOutbound](#) [get]
Is this bus heading inbound or outbound.
- string [JourneyCode](#) [get]
- string [RunningBoard](#) [get]
- bool [IsTimingPoint](#) [get]
- DateTime [SchArrivalTime](#) [get]
The scheduled arrival time for the bus.
- DateTime [SchDepartureTime](#) [get]
The scheduled departure time for the bus.
- [IBusService Service](#) [get]
Gets the related '[IBusService](#)' object relating to the time table record.

5.20.1 Detailed Description

A class which represents a single time table record, this is a time and particular bus stop for one service.

5.20.2 Member Function Documentation

5.20.2.1 GetId()

```
string Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable.GetId (
)
```

Used to get a unique ID value to represent the timetable record.

Returns

A value to represent the record.

Implemented in [Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable](#), [Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable](#) and [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusTimeTableStub](#).

5.20.2.2 MatchDirection()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable.Match↔
Direction (
    Direction direction )
```

Used to check if the direction of travel of this record matches the value or not.

Parameters

<i>direction</i>	
------------------	--

Returns

Implemented in [Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable](#), [Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTableStub](#) and [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusTimeTableStub](#).

5.20.2.3 WeakIsStopSame() [1/2]

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable.WeakIs↔
StopSame (
    IBusStop stop2 )
```

Used to say that if given a bus stop object is the stop about this timetable record or not.

Parameters

<i>stop2</i>	
--------------	--

Returns

Implemented in [Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable](#), [Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTableStub](#) and [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusTimeTableStub](#).

5.20.2.4 WeakIsStopSame() [2/2]

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable.WeakIs↔
StopSame (
    IBusTimeTable stop2 )
```

A faster way to compare if two [IBusTimeTable](#) records are about the same bus stop. By simply comparing their string atco code, as opposed to finding and comparing the two bus stop objects.

Parameters

<i>stop2</i>	Another time table record to compare against.
--------------	---

Returns

Implemented in [Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTable](#), [Timetable_Optimisation_Recommendations.Timetable_Evaluator.BlamedBusTimeTableStub](#) and [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.BusTimeTableStub](#).

5.20.3 Property Documentation

5.20.3.1 IsTimingPoint

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable.IsTimingPoint [get]
```

Is this bus stop a timing point or not.

A timing point is a major bus stop, where the buses is expected to wait if its early and should actually arrive on the scheduled time. All non-timing points times are only estimated scheduled times. A timing point is much more accurate and strict timings. A stop which is a timing point for one service is not necessarily a timing point for another service, hence it is stored here and not in the [IBusStop](#).

5.20.3.2 JourneyCode

```
string Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable.JourneyCode [get]
```

A unique value that groups a selection of time table records across different bus stops to show one loop/ cycle of a bus services route.

5.20.3.3 RunningBoard

```
string Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable.RunningBoard [get]
```

A running board value, represents a group of journeys that one driver is expected to perform. These are therefore sequential services, driven using the same vehicle.

5.20.3.4 Service

`IBusService` Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable.↔
 Service [get]

Gets the related 'IBusService' object relating to the time table record.

Returns

A 'BusService' object for this time table record.

The documentation for this interface was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Bus Operator API Interface/IBusTimeTable.cs

5.21 Timetable_Optimisation_Recommendations.Timetable_Simulator.↔ JourneyTime Class Reference

A simplistic class used to help represent the journey time between two stops.

Public Member Functions

- `JourneyTime` (`IBusSolidHistoricTimeTable` r1, `IBusSolidHistoricTimeTable` r2, bool isForwardProp)
The default journey time constructor, takes in two solid historical records and works out key metrics. It is important the two stops are in order, r1 is the first stop and r2 is the next stop.

Properties

- TimeSpan `TravelTime` [get]
The time it takes to travel between the two stops.
- TimeSpan `TimeOfInterest` [get]

5.21.1 Detailed Description

A simplistic class used to help represent the journey time between two stops.

5.21.2 Constructor & Destructor Documentation

5.21.2.1 JourneyTime()

```
Timetable_Optimisation_Recommendations.Timetable_Simulator.JourneyTime.JourneyTime (
    IBusSolidHistoricTimeTable r1,
    IBusSolidHistoricTimeTable r2,
    bool isForwardProp )
```

The default journey time constructor, takes in two solid historical records and works out key metrics. It is important the two stops are in order, r1 is the first stop and r2 is the next stop.

Parameters

<i>r1</i>	Timetable record one.
<i>r2</i>	Timetable record two.
<i>isForwardProp</i>	Is forward propagation active, else using backwards.

5.21.3 Property Documentation

5.21.3.1 TravelTime

TimeSpan Timetable_Optimisation_Recommendations.Timetable_Simulator.JourneyTime.TravelTime
[get]

The time it takes to travel between the two stops.

value> The time of departure at r1 (used for forwards propagation) or time of arrival at r2 (used for backward propagation). Dependent upon the input argument to the constructor.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Timetable Simulator/Journey↔ Time.cs

5.22 Timetable_Optimisation_Recommendations.Timetable_Simulator.↔ JourneyTimeSimulator Class Reference

The journey time simulator class takes in a theoretical departure time, two stops to travel between and some other information. It then estimates how long it would likely take to travel between the two stops at this time of day.

Inheritance diagram for Timetable_Optimisation_Recommendations.Timetable_Simulator.JourneyTimeSimulator:

Public Member Functions

- [JourneyTimeSimulator](#) (TimeSpan targetTime, IBusStop start, IBusStop end, IBusService[] services, Date↔ Time[] dates, bool isForwardProp=true)
Default constructor for the object, takes in all the required parameters.
- async Task< TimeSpan > [ProduceEstimatedTravelTimes](#) (IProgress< double >? progress=null)
Calculates the estimated journey time, at the specific date and time given between two stops.

Additional Inherited Members

5.22.1 Detailed Description

The journey time simulator class takes in a theoretical departure time, two stops to travel between and some other information. It then estimates how long it would likely take to travel between the two stops at this time of day.

5.22.2 Constructor & Destructor Documentation

5.22.2.1 JourneyTimeSimulator()

```
Timetable_Optimisation_Recommendations.Timetable_Simulator.JourneyTime↔
Simulator (
    TimeSpan targetTime,
    IBusStop start,
    IBusStop end,
    IBusService[] services,
    DateTime[] dates,
    bool isForwardProp = true )
```

Default constructor for the object, takes in all the required parameters.

Parameters

<i>targetTime</i>	The departure or arrival time of interest at the start stop. Dependent upon the direction of propagation.
<i>start</i>	The start stop.
<i>end</i>	The end stop.
<i>services</i>	A list of services that are known to go between the start and end stop consecutively.
<i>dates</i>	A list of dates for when the timetables where the same.
<i>isForwardProp</i>	Is Forward propagating time, default true, else backwards

5.22.3 Member Function Documentation

5.22.3.1 ProduceEstimatedTravelTimes()

```
async Task<TimeSpan> Timetable_Optimisation_Recommendations.Timetable_Simulator.JourneyTime↔
Simulator.ProduceEstimatedTravelTimes (
    IProgress< double >? progress = null )
```

Calculates the estimated journey time, at the specific date and time given between two stops.

Parameters

<code>progress</code>	Used to feed-back to the GUI the amount of progress made on the simulator.
-----------------------	--

Returns

The amount of time it would take to journey between the two stops.

If returns 0, there is no data to make an estimate, which would indicate no route goes between these two stops consecutively.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Timetable Simulator/Journey↔TimeSimulator.cs

5.23 Timetable_Optimisation_Recommendations.Timetable_↔Performance_Evaluator.LatenessRecord Class Reference

Used to represent the lateness of one single record.

Public Member Functions

- [LatenessRecord](#) ([IBusHistoricTimeTable](#) record)
The default constructor for the class, takes in a historical record and creates a lateness record out of it.

Properties

- double [Lateness](#) [get]
How late the service was
- DateTime [SchArrivalTime](#) [get]
- bool [IsLate](#) [get]
Returns true if late, which is earlier than one min or later than five min.

5.23.1 Detailed Description

Used to represent the lateness of one single record.

5.23.2 Constructor & Destructor Documentation

5.23.2.1 LatenessRecord()

```
Timetable_Optimisation_Recommendations.Timetable_Performance_Evaluator.LatenessRecord.Lateness↔
Record (
    IBusHistoricTimeTable record )
```

The default constructor for the class, takes in a historical record and creates a lateness record out of it.

Parameters

<i>record</i>	The historical timetable record representing it.
---------------	--

5.23.3 Property Documentation

5.23.3.1 IsLate

```
bool Timetable_Optimisation_Recommendations.Timetable_Performance_Evaluator.LatenessRecord.↔
IsLate [get]
```

Returns true if late, which is earlier than one min or later than five min.

5.23.3.2 Lateness

```
double Timetable_Optimisation_Recommendations.Timetable_Performance_Evaluator.LatenessRecord.↔
Lateness [get]
```

How late the service was

value>The time of day it was meant to have arrived, to see if lateness changes throughout the day.

The documentation for this class was generated from the following file:

- Timetable_Optimisation_Recommendations/Timetable_Optimisation_Recommendations/Timetable_Performance_Evaluator/LatenessRecord.cs

5.24 Timetable_Optimisation_Recommendations.Timetable_↔ Performance_Evaluator.LatenessReport Struct Reference

Used for MVVM to bind to the GUI, this contains data summerising the performance of a service.

Properties

- [IBusService Service](#) [get]
The Service the report pertains to.
- [double OnTimePercentage](#) [get]
value>The average lateness of a service in min.
- [string AvgLatenessString](#) [get]
value>The on time percentage formatted nicely as a string value.
- [string OnTimePercentageString](#) [get]

5.24.1 Detailed Description

Used for MVVM to bind to the GUI, this contains data summerising the performance of a service.

5.24.2 Property Documentation

5.24.2.1 Service

```
IBusService Timetable_Optimisation_Recommendations.Timetable_Performance_Evaluator.LatenessReport.Service [get]
```

The Service the report pertains to.

value>The On Time Percentage as a double.

The documentation for this struct was generated from the following file:

- Timetable_Optimisation_Recommendations/Timetable_Optimisation_Recommendations/Timetable_Performance_Evaluator/LatenessReport.cs

5.25 Timetable_Optimisation_Recommendations.UserControls.LatenessSummary Class Reference

The lateness summary report card, shows the performance of the service historically.

Inheritance diagram for Timetable_Optimisation_Recommendations.UserControls.LatenessSummary:

5.25.1 Detailed Description

The lateness summary report card, shows the performance of the service historically.

The documentation for this class was generated from the following file:

- Timetable_Optimisation_Recommendations/Timetable_Optimisation_Recommendations/UserControls/LatenessSummary.xaml.cs

5.26 Timetable_Optimisation_Recommendations.Pages.MainPage Class Reference

The main start page for the program, this is where the user will select the primary service that they wish to optimize for.

Inheritance diagram for Timetable_Optimisation_Recommendations.Pages.MainPage:

Public Member Functions

- [MainPage](#) ()
The default program entry point constructor.

Properties

- ObservableCollection< [IBusService](#) > [ServiceCardCollection](#) = new(BusOperatorFactory.Instance.↵
Operator.GetServices()) [get]
Stores a list of bus services that the operator operates.

5.26.1 Detailed Description

The main start page for the program, this is where the user will select the primary service that they wish to optimize for.

5.26.2 Constructor & Destructor Documentation

5.26.2.1 MainPage()

```
Timetable_Optimisation_Recommendations.Pages.MainPage.MainPage ( )
```

The default program entry point constructor.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Pages/MainPage.↵
xaml.cs

5.27 Timetable_Optimisation_Recommendations.Windows.MainWindow Class Reference

The main entry point for the application, but the logic is contained within the page.

Inheritance diagram for Timetable_Optimisation_Recommendations.Windows.MainWindow:

5.27.1 Detailed Description

The main entry point for the application, but the logic is contained within the page.

The documentation for this class was generated from the following file:

- Timetable_Optimisation_Recommendations/Timetable_Optimisation_Recommendations/Windows/MainWindow.xaml.cs

5.28 Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.Move Struct Reference

Used to represent a single move of the search algorithm, this involves making a change to one services timetable, on one running-board. A single timetable record is moved and then the surrounding records will also need to be edited in forwards and backwards propagation.

Public Member Functions

- override string [ToString](#) ()
Provides a string representation of the move. This is only accurate if TargetRecord.SetSuggestedToReal() hasn't already been called.

Properties

- [IBusService Service](#) [get]
States what service this moves alters.
- [BlamedBusTimeTable\[\] TimeTable](#) [get]
value> The IDs of the records in the timetable that have actually changed.
- List< string > [ChangedRecordsIDs](#) [get]
value> The total amount of minuets changes in the move from the initial solution.
- double [ChangeAmount](#) [get]
value> The new proposed scheduled arrival time.
- DateTime [ProposedSchArrivalTime](#) [get]
value> The new proposed scheduled departure time.
- DateTime [ProposedSchDepartureTime](#) [get]
value> The timetable record highlighted as being the problem.
- [BlamedBusTimeTable TargetRecord](#) [get]

5.28.1 Detailed Description

Used to represent a single move of the search algorithm, this involves making a change to one services timetable, on one running-board. A single timetable record is moved and then the surrounding records will also need to be edited in forwards and backwards propagation.

As such a move is represented as the service it is about and an array of blamed timetable records, which contain the new timetable for the service. Most records won't have actually moved.

5.28.2 Member Function Documentation

5.28.2.1 ToString()

```
override string Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.Move.ToString()
String ( )
```

Provides a string representation of the move. This is only accurate if TargetRecord.SetSuggestedToReal() hasn't already been called.

Returns

A string representation of the changes.

5.28.3 Property Documentation

5.28.3.1 Service

```
IBusService Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.Move.Service
[get]
```

States what service this moves alters.

value>The new timetable for the service after the move has been applied.

The documentation for this struct was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Search Algorithm/Tabu Search/Move.cs

5.29 Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.MoveSelector Class Reference

The move-selector is used to select the best move out of an array of moves, the neighborhood, to generate a new solution.

Public Member Functions

- [MoveSelector](#) ([TimeTableEvaluator](#) evaluator)
Default constructor, takes in a reference to the evaluator object.
- `async Task<(Solution, Move)> BestMoveSelectorAsync (Move[] moves, TabuList tabuList, IProgress<AdvancedProgressReporting>? progress=null)`
Given an array of moves, identify which is the best move and return the new solution with that move applied to it.

5.29.1 Detailed Description

The move-selector is used to select the best move out of an array of moves, the neighborhood, to generate a new solution.

5.29.2 Constructor & Destructor Documentation

5.29.2.1 MoveSelector()

```
Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.MoveSelector.MoveSelector
(
    TimeTableEvaluator evaluator )
```

Default constructor, takes in a reference to the evaluator object.

Parameters

<i>evaluator</i>	
------------------	--

5.29.3 Member Function Documentation

5.29.3.1 BestMoveSelectorAsync()

```
async Task<(Solution, Move)> Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_↵
Search.MoveSelector.BestMoveSelectorAsync (
    Move[] moves,
    TabuList tabuList,
    IProgress< AdvancedProgressReporting >? progress = null )
```

Given an array of moves, identify which is the best move and return the new solution with that move applied to it.

Parameters

<i>moves</i>	An array of possible moves to make.
<i>progress</i>	Used to report back to the GUI or listener of the progress of this task.

Returns

The best solution which is the best move applied to the current solution. Along with the selected move that got us there.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Search Algorithm/↔ Tabu Search/MoveSelector.cs

5.30 Timetable_Optimisation_Recommendations.Pages.MovesMade Class Reference

Used to display the moves that have been made by the search algorithm after it has completed and displays the finalized timetables.

Inheritance diagram for Timetable_Optimisation_Recommendations.Pages.MovesMade:

**Public Member Functions**

- **MovesMade** ([Solution](#) startSolution, [Solution](#) solution, int iterationOfBestMove, List<[Move](#) moves, int score)> movesMade)

The default constructor for the results page.

5.30.1 Detailed Description

Used to display the moves that have been made by the search algorithm after it has completed and displays the finalized timetables.

5.30.2 Constructor & Destructor Documentation**5.30.2.1 MovesMade()**

```

Timetable_Optimisation_Recommendations.Pages.MovesMade.MovesMade (
    Solution startSolution,
    Solution solution,
    int iterationOfBestMove,
    List<Move moves, int score)> movesMade )
  
```

The default constructor for the results page.

Parameters

<i>startSolution</i>	The original input solution.
<i>solution</i>	The best solution found.
<i>movesMade</i>	A list of moves that were made.
<i>iterationOfBestMove</i>	The iteration count where the best move was found.

The documentation for this class was generated from the following file:

- Timetable_Optimisation_Recommendations/Timetable_Optimisation_Recommendations/Pages/MovesMade.↵
xaml.cs

5.31 Timetable_Optimisation_Recommendations.Search_Algorithm.↵ Tabu_Search.NeighbourhoodSolution Class Reference

Used to generate the neighbourhood of solutions for the search algorithm.

Public Member Functions

- [NeighbourhoodSolution](#) ([TimeTableEvaluator](#) evaluator, int? neighbourhoodSize=null, int? candidateListSize=null)
The default constructor for the [NeighbourhoodSolution](#) class.
- async Task< [Move](#)[]> [GenerateNegibourhood](#) ([TabuList](#) tabuList, IProgress< [AdvancedProgressReporting](#)>? progress=null)
Generates the negibourhood of solutions, returns an array of tuples of solutions, the solution only contains changes to one service, it is assumed that all other services results won't have changed. This is done for efficiency purposes, to both save memory and because you don't need to recalculate objective function value on everything.

5.31.1 Detailed Description

Used to generate the neighbourhood of solutions for the search algorithm.

5.31.2 Constructor & Destructor Documentation

5.31.2.1 NeighbourhoodSolution()

```
Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.NeighbourhoodSolution.↵
NeighbourhoodSolution (
    TimeTableEvaluator evaluator,
    int? neighbourhoodSize = null,
    int? candidateListSize = null )
```

The default constructor for the [NeighbourhoodSolution](#) class.

Parameters

<i>evaluator</i>	A reference to the main evaluator.
<i>neighbourhoodSize</i>	The size of the neighborhood to generate, only needed if not default, should be greater than 1, preferably bigger..
<i>candidateListSize</i>	The size of the candidate list to generate, only needed if not default, should be less than or equal to neighborhood.

5.31.3 Member Function Documentation

5.31.3.1 GenerateNegibourhood()

```
async Task<Move[]> Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.↔
NeighbourhoodSolution.GenerateNegibourhood (
    TabuList tabuList,
    IProgress< AdvancedProgressReporting >? progress = null )
```

Generates the negibourhood of solutions, returns an array of tuples of solutions, the solution only contains changes to one service, it is assumed that all other services results won't have changed. This is done for efficiency purposes, to both save memory and because you don't need to recalculate objective function value on everything.

Returns

An array of solutions, one per candidate list.

It is theoretically possible, but very unlikely that this would return back zero moves. But it can do if a lot of the search space is tabu and there is only a small search space. Regardless this should be checked for.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Search Algorithm/↔ Tabu Search/NeighbourhoodSolution.cs

5.32 Timetable_Optimisation_Recommendations.UserControls.Notify↔ TaskCompletion< TResult > Class Template Reference

Helper class to wrap around a Task to provide more information usable for UI databinding scenarios. As discussed in MSDN Magazine: <https://msdn.microsoft.com/magazine/dn605875>.

Inheritance diagram for Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion< TResult >:

Public Member Functions

- [NotifyTaskCompletion](#) ([Task](#)< TResult > task)

Initializes a new instance of the [NotifyTaskCompletion< TResult >](#) class.

Properties

- Task< TResult > [Task](#) [get]
Gets the task that is being waited on.
- [Task](#) [TaskCompletion](#) [get]
Gets the task wrapper task.
- TResult?? [Result](#) [get]
Gets the result of the given task.
- TaskStatus [Status](#) [get]
Gets the status of the task.
- bool [IsCompleted](#) [get]
Gets a value indicating whether the task is completed.
- bool [IsNotCompleted](#) [get]
Gets a value indicating whether the task is not completed.
- bool [IsSuccessfullyCompleted](#) [get]
Gets a value indicating whether the task was successfully completed.
- bool [IsCanceled](#) [get]
Gets a value indicating whether the task was canceled.
- bool [IsFaulted](#) [get]
Gets a value indicating whether there was an error with the task.
- AggregateException [Exception](#) [get]
Gets the exception which occurred on the task (if one occurred).
- [Exception](#) [InnerException](#) [get]
Gets the inner exception of the task.
- string [ErrorMessage](#) [get]
Gets the error message of the task.

Events

- PropertyChangedEventHandler [PropertyChanged](#)
PropertyChanged event.

5.32.1 Detailed Description

Helper class to wrap around a Task to provide more information usable for UI databinding scenarios. As discussed in MSDN Magazine: <https://msdn.microsoft.com/magazine/dn605875>.

Template Parameters

<i>TResult</i>	Type of result returned by task.
----------------	----------------------------------

5.32.2 Constructor & Destructor Documentation

5.32.2.1 NotifyTaskCompletion()

```
Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion< TResult >.NotifyTaskCompletion  
(  
    Task< TResult > task )
```

Initializes a new instance of the [NotifyTaskCompletion<TResult>](#) class.

Parameters

<i>task</i>	Task to wait on.
-------------	------------------

5.32.3 Property Documentation

5.32.3.1 ErrorMessage

```
string Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion< TResult >.Error↵  
Message [get]
```

Gets the error message of the task.

5.32.3.2 Exception

```
AggregateException Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion<  
TResult >.Exception [get]
```

Gets the exception which occurred on the task (if one occurred).

5.32.3.3 InnerException

```
Exception Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion< TResult  
>.InnerException [get]
```

Gets the inner exception of the task.

5.32.3.4 IsCanceled

```
bool Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion< TResult >.Is↔  
Canceled [get]
```

Gets a value indicating whether the task was canceled.

5.32.3.5 IsCompleted

```
bool Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion< TResult >.Is↔  
Completed [get]
```

Gets a value indicating whether the task is completed.

5.32.3.6 IsFaulted

```
bool Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion< TResult >.Is↔  
Faulted [get]
```

Gets a value indicating whether there was an error with the task.

5.32.3.7 IsNotCompleted

```
bool Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion< TResult >.Is↔  
NotCompleted [get]
```

Gets a value indicating whether the task is not completed.

5.32.3.8 IsSuccessfullyCompleted

```
bool Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion< TResult >.Is↔  
SuccessfullyCompleted [get]
```

Gets a value indicating whether the task was successfully completed.

5.32.3.9 Result

```
TResult?? Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion< TResult  
>.Result [get]
```

Gets the result of the given task.

5.32.3.10 Status

```
TaskStatus Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion< TResult >.Status [get]
```

Gets the status of the task.

5.32.3.11 Task

```
Task<TResult> Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion< TResult >.Task [get]
```

Gets the task that is being waited on.

5.32.3.12 TaskCompletion

```
Task Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion< TResult >.Task↔Completion [get]
```

Gets the task wrapper task.

5.32.4 Event Documentation

5.32.4.1 PropertyChanged

```
PropertyChangedEventHandler Timetable_Optimisation_Recommendations.UserControls.NotifyTaskCompletion< TResult >.PropertyChanged
```

PropertyChanged event.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/UserControls/Notify↔TaskCompletion.cs

5.33 Timetable_Optimisation_Recommendations.Timetable_↔Performance_Evaluator.PerformanceEvaluator Class Reference

A class used to generate the performance of the historical/current timetables.

Public Member Functions

- void [AddRecords](#) ([IBusService](#) service, [IBusHistoricTimeTable](#)[]? records)
Used to add onto a services lateness record.
- void [GenerateLatenessReport](#) ()
Generates the summarized report for each service, this is what is being displayed to the end user.

Properties

- List< [LatenessReport](#) > [ServiceLatenessReports](#) = new() [get]

5.33.1 Detailed Description

A class used to generate the performance of the historical/current timetables.

5.33.2 Member Function Documentation

5.33.2.1 AddRecords()

```
void Timetable_Optimisation_Recommendations.Timetable_Performance_Evaluator.PerformanceEvaluator.AddRecords (
    IBusService service,
    IBusHistoricTimeTable?[] records )
```

Used to add onto a services lateness record.

Parameters

<i>service</i>	The service you are adding to.
<i>records</i>	The records to convert and add.

5.33.2.2 GenerateLatenessReport()

```
void Timetable_Optimisation_Recommendations.Timetable_Performance_Evaluator.PerformanceEvaluator.GenerateLatenessReport ( )
```

Generates the summarized report for each service, this is what is being displayed to the end user.

The documentation for this class was generated from the following file:

- Timetable_Optimisation_Recommendations/Timetable_Optimisation_Recommendations/Timetable_Performance_Evaluator/PerformanceEvaluator.cs

5.34 Timetable_Optimisation_Recommendations.Timetable_Evaluator.PreEvaluatorChecks Class Reference

Pre-evaluator checks is run before actually running the real evaluator and is used to download all of the data that is required and evaluate the performance of the old timetable.

Public Member Functions

- [PreEvaluatorChecks](#) ([Cluster](#) cluster, [RouteSegmentCollection](#) segmentCollection)
The default constructor for the class, takes in the objects created from the previous steps.
- [TimeTableEvaluator EvaluateTimeTable](#) ()
Produces the evaluator object from the pre-evaluator.
- async Task [DownloadAllFilesNeeded](#) (IProgress< [AdvancedProgressReporting](#) >? progress)
Does the work, downloads all of the data needed so that it is in tire 2 and 1 cache. Also works out the performance metrics of this data.

Properties

- [PerformanceEvaluator PerformanceEvaluator](#) = new() [get]
value> Keeps track of how many tasks to complete.

5.34.1 Detailed Description

Pre-evaluator checks is run before actually running the real evaluator and is used to download all of the data that is required and evaluate the performance of the old timetable.

5.34.2 Constructor & Destructor Documentation

5.34.2.1 PreEvaluatorChecks()

```
Timetable_Optimisation_Recommendations.Timetable_Evaluator.PreEvaluatorChecks.PreEvaluator↵
Checks (
    Cluster cluster,
    RouteSegmentCollection segmentCollection )
```

The default constructor for the class, takes in the objects created from the previous steps.

Parameters

<i>cluster</i>	Stores information about the dates to request data for.
<i>segmentCollection</i>	Stores information about the route segments.

5.34.3 Member Function Documentation

5.34.3.1 DownloadAllFilesNeeded()

```
async Task Timetable_Optimisation_Recommendations.Timetable_Evaluator.PreEvaluatorChecks.↔
DownloadAllFilesNeeded (
    IProgress< AdvancedProgressReporting >? progress )
```

Does the work, downloads all of the data needed so that it is in tire 2 and 1 cache. Also works out the performance metrics of this data.

Parameters

<i>progress</i>	Used to report back the progress to the GUI.
-----------------	--

Returns

Caches all of the required data for the search.

5.34.3.2 EvaluateTimeTable()

```
TimeTableEvaluator Timetable_Optimisation_Recommendations.Timetable_Evaluator.PreEvaluator↔
Checks.EvaluateTimeTable ( )
```

Produces the evaluator object from the pre-evaluator.

Returns

The final evaluator to actually perform the search

You shouldn't call this before DownloadAllFilesNeeded has been called and completed.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Timetable Evaluator/Pre↔ EvaluatorChecks.cs

5.35 Timetable_Optimisation_Recommendations.Pages.Preliminary↔ DataDownload Class Reference

The preliminary data download lets you download all of the data files that you are going to need for the search. It also lets you see the services past performance.

Inheritance diagram for Timetable_Optimisation_Recommendations.Pages.PreliminaryDataDownload:

Public Member Functions

- [PreliminaryDataDownload](#) ([Cluster](#) cluster, [RouteSegmentCollection](#) collection)

The default constructor, takes in the information from the previous pages.

Properties

- [AdvancedProgressReporting Reporter](#) = new() [get]

5.35.1 Detailed Description

The preliminary data download lets you download all of the data files that you are going to need for the search. It also lets you see the services past performance.

5.35.2 Constructor & Destructor Documentation

5.35.2.1 PreliminaryDataDownload()

```
Timetable_Optimisation_Recommendations.Pages.PreliminaryDataDownload.PreliminaryDataDownload (
    Cluster cluster,
    RouteSegmentCollection collection )
```

The default constructor, takes in the information from the previous pages.

Parameters

<i>cluster</i>	The dates that the user is requesting data for.
<i>collection</i>	All of the shared route-segments containing information on other services we also want data for.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Pages/Preliminary↵
DataDownload.xaml.cs

5.36 Timetable_Optimisation_Recommendations.Pages.Previous↵ Performance Class Reference

Once all of the data has been downloaded in the pre-evaluator checks show the performance metrics to the user. This is the final stage before starting the actual search.

Inheritance diagram for Timetable_Optimisation_Recommendations.Pages.PreviousPerformance:

Public Member Functions

- [PreviousPerformance](#) ([PreEvaluatorChecks](#) preEvaluator)

The default constructor to the page, takes in the pre-evaluator results

Properties

- `ObservableCollection< LatenessReport > ServiceCardCollection = new()` [get]

Used to store the list of services and their performance metrics.

5.36.1 Detailed Description

Once all of the data has been downloaded in the pre-evaluator checks show the performance metrics to the user. This is the final stage before starting the actual search.

5.36.2 Constructor & Destructor Documentation

5.36.2.1 PreviousPerformance()

```
Timetable_Optimisation_Recommendations.Pages.PreviousPerformance.PreviousPerformance (
    PreEvaluatorChecks preEvaluator )
```

The default constructor to the page, takes in the pre-evaluator results

Parameters

<i>preEvaluator</i>	The pre-evaluator results from the previous page.
---------------------	---

5.36.3 Property Documentation

5.36.3.1 ServiceCardCollection

```
ObservableCollection<LatenessReport> Timetable_Optimisation_Recommendations.Pages.Previous<←
Performance.ServiceCardCollection = new() [get]
```

Used to store the list of services and their performance metrics.

value>Used to store the results of the pre-evaluator to give it to the evaluator next.

The documentation for this class was generated from the following file:

- [Timetable_Optimisation_Recommendations/Timetable_Optimisation_Recommendations/Pages/Previous↔Performance.xaml.cs](#)

5.37 Timetable_Optimisation_Recommendations.ProgressReporting Class Reference

Used to report back the progress of th task to the GUI.

Inheritance diagram for Timetable_Optimisation_Recommendations.ProgressReporting:

Public Member Functions

- [ProgressReporting](#) ()
The default constructor, sets everything to be equal to zero.
- [ProgressReporting](#) (double value, string message)
A constructor used to specify a tasks progress and a message for the task.
- void [Update](#) ([ProgressReporting](#) reporter)
Used to update a progress reporter with information from another one.
- void [Clear](#) ()
Clears all values back to zero/null.

Protected Member Functions

- void [OnPropertyChanged](#) (string? name=null)
Used to tell the GUI to update whenever a value in th class is changed.

Properties

- double [Value](#) [get, set]
value> The message of the whole task, saying everything that has been completed.
- string [Message](#) [get, set]
value> Defines if a GUI element should be visible or not. Only shows the thing while progress is not completed.
- Visibility? [Visibility](#) [get]

Events

- [PropertyChangedEventHandler? PropertyChanged](#)
Used to tell the GUI to refresh/update to the actual value.

5.37.1 Detailed Description

Used to report back the progress of th task to the GUI.

5.37.2 Constructor & Destructor Documentation

5.37.2.1 ProgressReporting() [1/2]

```
Timetable_Optimisation_Recommendations.ProgressReporting.ProgressReporting ( )
```

The default constructor, sets everything to be equal to zero.

5.37.2.2 ProgressReporting() [2/2]

```
Timetable_Optimisation_Recommendations.ProgressReporting.ProgressReporting (
    double value,
    string message )
```

A constructor used to specify a tasks progress and a message for the task.

Parameters

<i>value</i>	The overall progress for the task.
<i>message</i>	The message of the last completed task.

5.37.3 Member Function Documentation

5.37.3.1 Clear()

```
void Timetable_Optimisation_Recommendations.ProgressReporting.Clear ( )
```

Clears all values back to zero/null.

5.37.3.2 OnPropertyChanged()

```
void Timetable_Optimisation_Recommendations.ProgressReporting.OnPropertyChanged (
    string? name = null ) [protected]
```

Used to tell the GUI to update whenever a value in th class is changed.

Parameters

<i>name</i>	
-------------	--

5.37.3.3 Update()

```
void Timetable_Optimisation_Recommendations.ProgressReporting.Update (
    ProgressReporting reporter )
```

Used to update a progress reporter with information from another one.

Parameters

<i>reporter</i>	The progress reporter to take in feedback from.
-----------------	---

5.37.4 Event Documentation

5.37.4.1 PropertyChanged

```
PropertyChangedEventHandler? Timetable_Optimisation_Recommendations.ProgressReporting.↵
PropertyChanged
```

Used to tell the GUI to refresh/update to the actual value.

value>The value of the task as a whole.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/ProgressReporting.cs

5.38 Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusOperator Class Reference

An Implementation of the [IBusOperator](#) interface for the Reading Buses API.

Inheritance diagram for Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusOperator:

Public Member Functions

- bool [IsService](#) (string serviceNumber)
Checks to see if a service of that number exists or not in the API feed.
- [IBusStop GetLocation](#) (string atcoCode)
Get a bus stop location based upon a bus stops location code
- bool [IsLocation](#) (string atcoCode)
Checks to see if the atco code for the bus stop exists in the API feed or not.
- void [InvalidateCache](#) ()
Deletes any Cache data stored, use this only if you need to force new data cache.
- [IBusService GetService](#) (string serviceNumber)
Returns a service which matches the Service Number passed.
- void [ForceUpdateCache](#) ()
Forces the current data stored in the bus operator object to be saved into Cache. You would need to do this if you've made some lazy API requests.
- [IBusService\[\] GetServices](#) ()
Gets an array of all the IBusServices Objects.

Static Public Member Functions

- static async Task< [IBusOperator](#) > [Initialise](#) (string apiKey)
Used to initially initialise the [ReadingBuses](#) Object, it is recommended you do this in your programs start up.
- static [IBusOperator GetInstance](#) ()

Static Public Attributes

- static readonly string **CacheDirectory** = "cache/ReadingBuses"

Properties

- ConcurrentDictionary< string, [RbBusStop](#) > **Locations** = new() [get]
- ConcurrentDictionary< string, [RbBusService](#) > **Services** = new() [get]

5.38.1 Detailed Description

An Implementation of the [IBusOperator](#) interface for the Reading Buses API.

5.38.2 Member Function Documentation

5.38.2.1 ForceUpdateCache()

```
void Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBus↔
Operator.ForceUpdateCache ( )
```

Forces the current data stored in the bus operator object to be saved into Cache. You would need to do this if you've made some lazy API requests.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator](#).

5.38.2.2 GetLocation()

```
IBusStop Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.Rb↔
BusOperator.GetLocation (
    string atcoCode )
```

Get a bus stop location based upon a bus stops location code

Parameters

<i>atcoCode</i>	The code of the bus stop
-----------------	--------------------------

Returns

A Bus Stop object for the Atco Code specified.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator](#).

5.38.2.3 GetService()

```
IBusService Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.↔
RbBusOperator.GetService (
    string serviceNumber )
```

Returns a service which matches the Service Number passed.

Parameters

<i>serviceNumber</i>	The service number/ID for the service you wish to be returned eg: 17 or 22.
----------------------	---

Returns

The services matching the ID.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator](#).

5.38.2.4 GetServices()

```
IBusService [] Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusOperator.GetServices ( )
```

Gets an array of all the IBusServices Objects.

Returns

An array of all the bus services.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator](#).

5.38.2.5 Initialise()

```
static async Task<IBusOperator> Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusOperator.Initialise (
    string apiKey ) [static]
```

Used to initially initialise the [ReadingBuses](#) Object, it is recommended you do this in your programs start up.

Parameters

<i>apiKey</i>	The Reading Buses API Key, get your own from http://rtl2.ods-live.co.uk/cms/apiservice
---------------	--

Returns

An instance of the library controller. This same instance can be got by calling the "GetInstance" method.

Exceptions

<i>ReadingBusesApiExceptionBadQuery</i>	Can throw an exception if you pass an invalid or expired API Key.
---	---

See `Bus_Operator_API_Interface.ReadingBuses.GetInstance()` to get any future instances afterwards.

5.38.2.6 InvalidateCache()

```
void Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBus↔
Operator.InvalidateCache ( )
```

Deletes any Cache data stored, use this only if you need to force new data cache.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator](#).

5.38.2.7 IsLocation()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBus↔
Operator.IsLocation (
    string atcoCode )
```

Checks to see if the acto code for the bus stop exists in the API feed or not.

Parameters

<i>atcoCode</i>	The ID Code for a bus stop.
-----------------	-----------------------------

Returns

True or False depending on if the stop is in the API feed or not.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator](#).

5.38.2.8 IsService()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBus↔
Operator.IsService (
    string serviceNumber )
```

Checks to see if a service of that number exists or not in the API feed.

Parameters

<i>serviceNumber</i>	The service number to find.
----------------------	-----------------------------

Returns

True or False for if a service is the API feed or not.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator](#).

The documentation for this class was generated from the following file:

- Timetable_Optimisation_Recommendations/Timetable_Optimisation_Recommendations/Bus_Operator_API_Interface/ReadingBuses/RB_BusOperator.cs

5.39 Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusService Class Reference

An Implementation of the [IBusService](#) interface for the Reading Buses API.

Inheritance diagram for [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusService](#):

Public Member Functions

- `async Task< IBusStop[] > GetLocations (Direction direction=Direction.Both)`
Gets an array of 'BusStop' objects the bus service travels too as an array of BusStop objects. If the API is invalid and links to a Bus Stop not in the list of locations it will simply be ignored.
- `bool IsArchivedTimeTableCached (DateTime date)`
Tells you if a file has been cached or not on disk.
- `bool IsWeakServiceSame (IBusService service)`
Given another IBusService Object, check if it is the same service or not. Only by comparing the service ID value.
- `async Task< IBusHistoricTimeTable[]? > GetArchivedTimeTable (DateTime date)`
Gets the archived real bus departure and arrival times along with their time table history for this service on a specific date.
- `bool IsTimeTableCached (DateTime date)`
Tells you if a file has been cached or not on disk.
- `async Task< IBusTimeTable[]? > GetTimeTable (DateTime date)`
Gets the planned timetable departure and arrival times for this service on a specific date.
- `override string ToString ()`
- `override int GetHashCode ()`
- `override bool Equals (object? obj)`
- `bool Equals (RbBusService? other)`

Static Public Member Functions

- `static operator RbBusService (BusService service)`

Properties

- `string ServiceId = string.Empty [get]`

5.39.1 Detailed Description

An Implementation of the [IBusService](#) interface for the Reading Buses API.

5.39.2 Member Function Documentation

5.39.2.1 GetArchivedTimeTable()

```
async Task<IBusHistoricTimeTable[]?> Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.
ReadingBuses.RbBusService.GetArchivedTimeTable (
    DateTime date )
```

Gets the archived real bus departure and arrival times along with their time table history for this service on a specific date.

Parameters

<i>date</i>	the date on which you want a archived timetable data for. This should be a date in the past.
-------------	--

Returns

An array of time table records, containing the scheduled and actual arrival and departure times of buses.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusService](#).

5.39.2.2 GetLocations()

```
async Task<IBusStop[]> Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.
ReadingBuses.RbBusService.GetLocations (
    Direction direction = Direction.Both )
```

Gets an array of 'BusStop' objects the bus service travels too as an array of BusStop objects. If the API is invalid and links to a Bus Stop not in the list of locations it will simply be ignored.

Parameters

<i>direction</i>	Used to filter by the direction of travel the stops are on.
------------------	---

Returns

An array of BusStop objects for the stops visited by this service.

It is assumed that the ordering of the array is the ordering in which a service will visit all of the stops. If the ordering is incorrect the route-segment finder will fail.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusService](#).

5.39.2.3 GetTimeTable()

```
async Task<IBusTimeTable[]?> Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusService.GetTimeTable (
    DateTime date )
```

Gets the planned timetable departure and arrival times for this service on a specific date.

Parameters

<i>date</i>	the date on which you want a archived timetable data for. This should be a date in the past.
-------------	--

Returns

An array of time table records, containing the planned scheduled and actual arrival and departure times of buses.

 Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusService](#).

5.39.2.4 IsArchivedTimeTableCached()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusService.IsArchivedTimeTableCached (
    DateTime date )
```

Tells you if a file has been cached or not on disk.

Parameters

<i>date</i>	The date for the time table date to search for.
-------------	---

Returns

True if the data is cached on disk

[GetArchivedTimeTable\(DateTime\)](#)

 Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusService](#).

5.39.2.5 IsTimeTableCached()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBus↔
Service.IsTimeTableCached (
    DateTime date )
```

Tells you if a file has been cached or not on disk.

Parameters

<i>date</i>	The date for the time table date to search for.
-------------	---

Returns

True if the data is cached on disk

[GetTimeTable\(DateTime\)](#)

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusService](#).

5.39.2.6 IsWeakServiceSame()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBus↔
Service.IsWeakServiceSame (
    IBusService service )
```

Given another [IBusService](#) Object, check if it is the same service or not. Only by comparing the service ID value.

Parameters

<i>service</i>	The other service you wish to compare against.
----------------	--

Returns

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusService](#).

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Bus Operator API Interface/ReadingBuses/RB_BusService.cs

5.40 Timetable_Optimisation_Recommendations.Bus_Operator_API_↔ Interface.ReadingBuses.RbBusStop Class Reference

An Implementation of the [IBusStop](#) interface for the Reading Buses API.

Inheritance diagram for Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBusStop:

Public Member Functions

- [IBusService\[\] GetServices](#) ()
Finds the 'BusService' object for all of the bus services which visit this stop.
- bool [IsArchivedTimeTableCached](#) (DateTime date)
Tells you if a file has been cached or not on disk.
- async Task< [IBusHistoricTimeTable\[\]?> GetArchivedTimeTable](#) (DateTime date)
Gets the archived real bus departure and arrival times along with their time table history at this specific bus stop.
- async Task< [IBusHistoricTimeTable\[\]?> GetWeakArchivedTimeTable](#) (DateTime date)
Get "Weak" archived timetable doesn't actually call-upon the API feed. It will look at the cached data on disk, finding services that visit the stop, ask for all their timetables and then filter out all the records that are not about this stop. This means that you might end up missing out on some data if you've not cached the service. However it will be significantly faster than actually calling upon the API feed.
- override bool **Equals** (object? obj)
- bool **Equals** ([RbBusStop](#)? other)
- override int **GetHashCode** ()
- override string **ToString** ()

Static Public Member Functions

- static operator **RbBusStop** (BusStop stop)

Properties

- string **AtcoCode** = string.Empty [get]
- string **CommonName** = string.Empty [get]
- string **Latitude** = string.Empty [get]
- string **Longitude** = string.Empty [get]
- string **Bearing** = string.Empty [get]
- string?[] **Services** [get]

5.40.1 Detailed Description

An Implementation of the [IBusStop](#) interface for the Reading Buses API.

5.40.2 Member Function Documentation

5.40.2.1 GetArchivedTimeTable()

```

async Task<IBusHistoricTimeTable\[\]?> Timetable\_Optimisation\_Recommendations.Bus\_Operator\_API\_Interface.ReadingBuses.RbBusStop.GetArchivedTimeTable \(
    DateTime date \)
    
```

Gets the archived real bus departure and arrival times along with their time table history at this specific bus stop.

Parameters

<i>date</i>	The date you want time table data for. This should be a date in the past.
-------------	---

Returns

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusStop](#).

5.40.2.2 GetServices()

```
IBusService [] Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.Reading↔
Buses.RbBusStop.GetServices ( )
```

Finds the 'BusService' object for all of the bus services which visit this stop.

Returns

A list of BusService Objects for services which visit this bus stop.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusStop](#).

5.40.2.3 GetWeakArchivedTimeTable()

```
async Task<IBusHistoricTimeTable[]?> Timetable_Optimisation_Recommendations.Bus_Operator_↔
API_Interface.ReadingBuses.RbBusStop.GetWeakArchivedTimeTable (
    DateTime date )
```

Get "Weak" archived timetable doesn't actually call-upon the API feed. It will look at the cached data on disk, finding services that visit the stop, ask for all their timetables and then filter out all the records that are not about this stop. This means that you might end up missing out on some data if you've not cached the service. However it will be significantly faster than actually calling upon the API feed.

Parameters

<i>date</i>	The date to get stop timetable data from.
-------------	---

Returns

Timetable data for the stop, made up of any cache data about it.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusStop](#).

5.40.2.4 IsArchivedTimeTableCached()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbBus↔
Stop.IsArchivedTimeTableCached (
    DateTime date )
```

Tells you if a file has been cached or not on disk.

Parameters

<i>date</i>	The date for the time table date to search for.
-------------	---

Returns

True if the data is cached on disk

[GetArchivedTimeTable\(DateTime\)](#)

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusStop](#).

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Bus Operator API Interface/ReadingBuses/RB_BusStop.cs

5.41 Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbTimeTable Class Reference

An Implementation of the IBusTimetable interface for the Reading Buses API.

Inheritance diagram for Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.Reading↔Buses.RbTimeTable:

Public Member Functions

- bool [WeakIsStopSame](#) (IBusTimeTable stop2)
A faster way to compare if two IBusTimeTable records are about the same bus stop. By simply comparing their string atco code, as opposed to finding and comparing the two bus stop objects.
- string [GetId](#) ()
Used to get a unique ID value to represent the timetable record.
- bool [WeakIsStopSame](#) (IBusStop stop2)
Used to say that if given a bus stop object is the stop about this timetable record or not.
- bool [MatchDirection](#) (Direction direction)
Used to check if the direction of travel of this record matches the value or not.

Static Public Member Functions

- static **operator RbTimeTable** (BusTimeTable inputTimeTable)

Protected Attributes

- string **ServiceId** = string.Empty
- string **AtcoCode** = string.Empty

Properties

- long **Sequence** [get, protected set]
- bool **IsOutbound** [get, protected set]
- string **JourneyCode** = string.Empty [get, protected set]
- bool **IsTimingPoint** [get, protected set]
- DateTime **SchArrivalTime** [get, protected set]
- DateTime **SchDepartureTime** [get, protected set]
- string **RunningBoard** = string.Empty [get, protected set]
- [IBusService](#) **Service** [get, protected set]
- [IBusStop](#) **Location** [get, protected set]

5.41.1 Detailed Description

An Implementation of the IBusTimetable interface for the Reading Buses API.

5.41.2 Member Function Documentation

5.41.2.1 GetId()

```
string Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbTime↔
Table.GetId ( )
```

Used to get a unique ID value to represent the timetable record.

Returns

A value to represent the record.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable](#).

5.41.2.2 MatchDirection()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbTime↔
Table.MatchDirection (
    Direction direction )
```

Used to check if the direction of travel of this record matches the value or not.

Parameters

<i>direction</i>	
------------------	--

Returns

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable](#).

5.41.2.3 WeakIsStopSame() [1/2]

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbTime↔
Table.WeakIsStopSame (
    IBusStop stop2 )
```

Used to say that if given a bus stop object is the stop about this timetable record or not.

Parameters

<i>stop2</i>	
--------------	--

Returns

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable](#).

5.41.2.4 WeakIsStopSame() [2/2]

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbTime↔
Table.WeakIsStopSame (
    IBusTimeTable stop2 )
```

A faster way to compare if two [IBusTimeTable](#) records are about the same bus stop. By simply comparing their string atco code, as opposed to finding and comparing the two bus stop objects.

Parameters

<i>stop2</i>	Another time table record to compare against.
--------------	---

Returns

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusTimeTable](#).

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Bus Operator API Interface/ReadingBuses/RB_TimeTable.cs

5.42 Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbTimeTableHistoric Class Reference

An Implementation of the IBusHistoricTimetable interface for the Reading Buses API.

Inheritance diagram for Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbTimeTableHistoric:

Public Member Functions

- bool [CouldBeSolid](#) ()
Returns if the record could be made a "solid" record or not. A solid record is one with reported arrival and departure times.
- [IBusSolidHistoricTimeTable GetSolid](#) ()
Gets the solid representation of the same object.

Static Public Member Functions

- static **operator RbTimeTableHistoric** (ArchivedBusTimeTable inputTimeTable)

Properties

- DateTime? **ActArrivalTime** [get]
- DateTime? **ActDepartureTime** [get]

Additional Inherited Members

5.42.1 Detailed Description

An Implementation of the IBusHistoricTimetable interface for the Reading Buses API.

5.42.2 Member Function Documentation

5.42.2.1 CouldBeSolid()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbTime↔
TableHistoric.CouldBeSolid ( )
```

Returns if the record could be made a "solid" record or not. A solid record is one with reported arrival and departure times.

Returns

true if Actual Arrival and Departure have values.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusHistoricTimeTable](#).

5.42.2.2 GetSolid()

```
IBusSolidHistoricTimeTable Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.↔
ReadingBuses.RbTimeTableHistoric.GetSolid ( )
```

Gets the solid representation of the same object.

Returns

Gets the solid equivalence object.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusHistoricTimeTable](#).

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Bus Operator API Interface/ReadingBuses/RB_TimeTableHistoric.cs

5.43 Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbTimeTableSolidHistoric Class Reference

An Implementation of the [IBusSolidHistoricTimeTable](#) interface for the Reading Buses API.

Inheritance diagram for Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.Reading↔Buses.RbTimeTableSolidHistoric:

Static Public Member Functions

- static [operator RbTimeTableSolidHistoric](#) ([RbTimeTableHistoric](#) inputTimeTable)
Converts between a non-solid to solid object.

Properties

- DateTime **ActArrivalTime** [get]
- DateTime **ActDepartureTime** [get]

Additional Inherited Members

5.43.1 Detailed Description

An Implementation of the [IBusSolidHistoricTimeTable](#) interface for the Reading Buses API.

5.43.2 Member Function Documentation

5.43.2.1 operator RbTimeTableSolidHistoric()

```
static Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.ReadingBuses.RbTime←
TableSolidHistoric.operator RbTimeTableSolidHistoric (
    RbTimeTableHistoric inputTimeTable ) [explicit], [static]
```

Converts between a non-solid to solid object.

Parameters

<i>inputTimeTable</i>	The non-solid input record.
-----------------------	-----------------------------

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Bus Operator API Interface/ReadingBuses/RB_TimeTableSolidHistoric.cs

5.44 Timetable_Optimisation_Recommendations.Properties.Resources Class Reference

A strongly-typed resource class, for looking up localized strings, etc.

Properties

- static global::System.Resources.ResourceManager [ResourceManager](#) [get]
Returns the cached ResourceManager instance used by this class.
- static global::System.Globalization.CultureInfo [Culture](#) [get, set]
Overrides the current thread's CurrentUICulture property for all resource lookups using this strongly typed resource class.

- static string [AverageLateness](#) [get]
Looks up a localized string similar to Average Lateness: {0}.
- static string [Cluster_NoOfDays](#) [get]
Looks up a localized string similar to Number of days associated : #.
- static string [OnTimePercentage](#) [get]
Looks up a localized string similar to On Time Percentage: {0}.
- static string [ServiceString](#) [get]
Looks up a localized string similar to Service {0}.

5.44.1 Detailed Description

A strongly-typed resource class, for looking up localized strings, etc.

5.44.2 Property Documentation

5.44.2.1 AverageLateness

```
string Timetable_Optimisation_Recommendations.Properties.Resources.AverageLateness [static],  
[get]
```

Looks up a localized string similar to Average Lateness: {0}.

5.44.2.2 Cluster_NoOfDays

```
string Timetable_Optimisation_Recommendations.Properties.Resources.Cluster_NoOfDays [static],  
[get]
```

Looks up a localized string similar to Number of days associated : #.

5.44.2.3 Culture

```
global.System.Globalization.CultureInfo Timetable_Optimisation_Recommendations.Properties.↔  
Resources.Culture [static], [get], [set]
```

Overrides the current thread's `CurrentUICulture` property for all resource lookups using this strongly typed resource class.

5.44.2.4 OnTimePercentage

```
string Timetable_Optimisation_Recommendations.Properties.Resources.OnTimePercentage [static],
[get]
```

Looks up a localized string similar to On Time Percentage: {0}.

5.44.2.5 ResourceManager

```
global.System.Resources.ResourceManager Timetable_Optimisation_Recommendations.Properties.↵
Resources.ResourceManager [static], [get]
```

Returns the cached ResourceManager instance used by this class.

5.44.2.6 ServiceString

```
string Timetable_Optimisation_Recommendations.Properties.Resources.ServiceString [static],
[get]
```

Looks up a localized string similar to Service {0}.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Properties/Resources.↵
Designer.cs

5.45 Timetable_Optimisation_Recommendations.Route_Analyser.↵ RouteSegment Class Reference

Route Segment is set of consecutive stops that two services share, the primary service, identified in the Route↵
SegmenetFinder and the secondary service that also shares it.

Public Member Functions

- int [LengthOfSegment](#) ()
Finds the length of the segment of stops.

Properties

- [IBusService SecondaryService](#) [get]
The other service that shares the route segment.
- List< [IBusStop](#) > [Stops](#) = new() [get]
Defines the set of consecutive stops that makes up the route segment.

5.45.1 Detailed Description

Route Segment is set of consecutive stops that two services share, the primary service, identified in the Route↔
SegmentFinder and the secondary service that also shares it.

5.45.2 Member Function Documentation

5.45.2.1 LengthOfSegment()

```
int Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegment.LengthOfSegment ( )
```

Finds the length of the segment of stops.

Returns

The length of the segment.

5.45.3 Property Documentation

5.45.3.1 SecondaryService

```
IBusService Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegment.Secondary↔  
Service [get]
```

The other service that shares the route segment.

5.45.3.2 Stops

```
List<IBusStop> Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegment.Stops =  
new() [get]
```

Defines the set of consecutive stops that makes up the route segment.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Route Analyser/Route↔
Segment.cs

5.46 Timetable_Optimisation_Recommendations.Route_Analyser. RouteSegmentCollection Class Reference

The [RouteSegmentCollection](#) class manages the results of the [RouteSegmentFinder](#), and provides the logic for part of the GUI, which lets the user add or remove a service of interest.

Public Member Functions

- async Task [InitialiseAsync](#) ([RouteSegmentFinder](#) finderObj, [IProgress](#)< [ProgressReporting](#) >? progress=null)
Used to actually initialise the object, given a route segment finder and a progress reporter.
- async Task [AddService](#) ([IBusService](#) service, [IProgress](#)< [ProgressReporting](#) >? progress)
Adds in a specific service to be included as part of the search.
- void [RemoveServiceAsync](#) ([IBusService](#) service)
Removes a service from the search.
- [IBusService](#)[] [GetServices](#) ([IBusStop](#) s1, [IBusStop](#) s2)
Given to bus stops, stop 1 and stop 2 find all the services that go between it. There is no guarantee that they do so consecutively
- async Task< [IBusService](#)[] > [GetAllServicesAsync](#) ([IProgress](#)< [ProgressReporting](#) >? progress)
Gets an array of all the bus services that are apart of all route segments.
- async Task< [IBusStop](#)[] > [GetAllSharedBusStopsAsync](#) ([IProgress](#)< [ProgressReporting](#) >? progress)
Gets all stops that are apart of a shared route segment.
- [IBusStop](#)[] [GetSharedBusStopsAsync](#) ()
Gets an array of bus stops apart of the shared route-segment, including only stops that contains services that has been included. Unlike the GetAllSharedBusStopsAsync method above.

Properties

- Dictionary< [IBusStop](#), List< [IBusService](#) > > [ServicesAtStopOfInterest](#) = new() [get]
value>Used by the GUI to store the included services.
- ObservableCollection< [IBusService](#) > [IncludedServices](#) = new() [get]
value>Used by the GUI to store the excluded services.
- ObservableCollection< [IBusService](#) > [ExcludedServices](#) = new() [get]
value>Contains an array of all the services across all of the route segments.

5.46.1 Detailed Description

The [RouteSegmentCollection](#) class manages the results of the [RouteSegmentFinder](#), and provides the logic for part of the GUI, which lets the user add or remove a service of interest.

5.46.2 Member Function Documentation

5.46.2.1 AddService()

```
async Task Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegmentCollection.AddService (
    IBusService service,
    IProgress< ProgressReporting >? progress )
```

Adds in a specific service to be included as part of the search.

Parameters

<i>service</i>	The service that you wish to add to the search space
<i>progress</i>	The progress of the task, shouldn't ever take very long.

Returns

5.46.2.2 GetAllServicesAsync()

```
async Task<IBusService[]> Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegment↔  
Collection.GetAllServicesAsync (   
    IProgress< ProgressReporting >? progress )
```

Gets an array of all the bus services that are apart of all route segments.

Parameters

<i>progress</i>	The progress reporter for this task.
-----------------	--------------------------------------

Returns

An array of all services in the route segment.

This should only be used to check if you have all services cached and if you want to add all services. This does NOT give all services that are actually included. (it also includes excluded)

5.46.2.3 GetAllSharedBusStopsAsync()

```
async Task<IBusStop[]> Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegment↔  
Collection.GetAllSharedBusStopsAsync (   
    IProgress< ProgressReporting >? progress )
```

Gets all stops that are apart of a shared route segment.

Parameters

<i>progress</i>	The progress reporter for the task.
-----------------	-------------------------------------

Returns

An array of bus stops that are apart of a shared route segment.

5.46.2.4 GetServices()

```
IBusService [] Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegmentCollection.Get↔
GetServices (
    IBusStop s1,
    IBusStop s2 )
```

Given to bus stops, stop 1 and stop 2 find all the services that go between it. There is no guarantee that they do so consecutively

Parameters

<i>s1</i>	Bus Stop 1
<i>s2</i>	Bus Stop 2

Returns

5.46.2.5 GetSharedBusStopsAsync()

```
IBusStop [] Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegmentCollection.Get↔
SharedBusStopsAsync ( )
```

Gets an array of bus stops apart of the shared route-segment, including only stops that contains services that has been included. Unlike the GetAllSharedBusStopsAsync method above.

Returns

All stops that are apart of a shared route segment.

5.46.2.6 InitialiseAsync()

```
async Task Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegmentCollection.↔
InitialiseAsync (
    RouteSegmentFinder finderObj,
    IProgress< ProgressReporting >? progress = null )
```

Used to actually initialise the object, given a route segment finder and a progress reporter.

Parameters

<i>finderObj</i>	
<i>progress</i>	

Returns

5.46.2.7 RemoveServiceAsync()

```
void Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegmentCollection.Remove↵
ServiceAsync (
    IBusService service )
```

Removes a service from the search.

Parameters

<code>service</code>	The service that you wish to remove.
----------------------	--------------------------------------

The documentation for this class was generated from the following file:

- Timetable_Optimisation_Recommendations/Timetable_Optimisation_Recommendations/Route_Analyser/Route↵
SegmentCollection.cs

5.47 Timetable_Optimisation_Recommendations.Route_Analyser.↵ RouteSegmentFinder Class Reference

The route segment finder class takes in a Bus Service (known as the primary service) and a tolerance. It then finds any service which shares a common-route segment with it, to the specified minimum segment length tolerance.

Public Member Functions

- [RouteSegmentFinder](#) ([IBusService](#) primaryService, int? routeSegmentMinimum=null)
Default constructor for the route segment finder.
- async Task< List< [RouteSegment](#) > > [FindSharedRouteSegmentsAsync](#) (IProgress< [ProgressReporting](#) >? progress)
Finds any services which might have a shared route segment and what the segment contains.
- async Task< [IBusService](#)[] > [GetServicesInSegments](#) (IProgress< [ProgressReporting](#) >? progress)
Finds all the distinct services which shared a route segment with us. One secondary service might have multiple segments, if they diverged and re-join or inbound and outbound.

Properties

- [IBusService PrimaryService](#) [get]

5.47.1 Detailed Description

The route segment finder class takes in a Bus Service (known as the primary service) and a tolerance. It then finds any service which shares a common-route segment with it, to the specified minimum segment length tolerance.

The primary purpose of this is to find the shared bus-corridors.

5.47.2 Constructor & Destructor Documentation

5.47.2.1 RouteSegmentFinder()

```
Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegmentFinder.RouteSegmentFinder (
    IBusService primaryService,
    int? routeSegmentMinimum = null )
```

Default constructor for the route segment finder.

Parameters

<i>primaryService</i>	The service you want to find common route segments with
<i>routeSegmentMinimum</i>	the minimum length of a route segment to count, only used if you wish to override settings variable.

5.47.3 Member Function Documentation

5.47.3.1 FindSharedRouteSegmentsAsync()

```
async Task<List<RouteSegment> > Timetable_Optimisation_Recommendations.Route_Analyser.Route↵
SegmentFinder.FindSharedRouteSegmentsAsync (
    IProgress< ProgressReporting >? progress )
```

Finds any services which might have a shared route segment and what the segment contains.

Returns

A list of found route segments.

5.47.3.2 GetServicesInSegments()

```
async Task<IBusService[]> Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegmentFinder.GetServicesInSegments (
    IProgress< ProgressReporting >? progress )
```

Finds all the distinct services which shared a route segment with us. One secondary service might have multiple segments, if they diverged and re-join or inbound and outbound.

Returns

An array of distinct services that have a route segment with the primary service.

This includes it self, the primary service.

5.47.4 Property Documentation

5.47.4.1 PrimaryService

```
IBusService Timetable_Optimisation_Recommendations.Route_Analyser.RouteSegmentFinder.PrimaryService [get]
```

The primary service for which you want to find services that share a route segment with.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Route Analyser/RouteSegmentFinder.cs

5.48 Timetable_Optimisation_Recommendations.Pages.RouteSegmentSelector Class Reference

The route-segment selector page finds other services that share a common route-segment with the primary service. And then allows the user to accept secondary services to also optimise their timetables for.

Inheritance diagram for Timetable_Optimisation_Recommendations.Pages.RouteSegmentSelector:

Public Member Functions

- [RouteSegmentSelector](#) (Cluster cluster)

The default constructor, takes in the dates from the other services.

Properties

- [RouteSegmentCollection Collection](#) = new() [get]
value>Used to update the GUI and report progress.
- [ProgressReporting Reporter](#) = new() [get]

5.48.1 Detailed Description

The route-segment selector page finds other services that share a common route-segment with the primary service. And then allows the user to accept secondary services to also optimism their timetables for.

5.48.2 Constructor & Destructor Documentation

5.48.2.1 RouteSegmentSelector()

```
Timetable_Optimisation_Recommendations.Pages.RouteSegmentSelector.RouteSegmentSelector (
    Cluster cluster )
```

The default constructor, takes in the dates from the other services.

Parameters

<i>cluster</i>	Dates of interest for the search.
----------------	-----------------------------------

The documentation for this class was generated from the following file:

- Timetable_Optimisation_Recommendations/Timetable_Optimisation_Recommendations/Pages/RouteSegmentSelector.xaml.cs

5.49 Timetable_Optimisation_Recommendations.UserControls.ServiceCard Class Reference

The service card, use to display the single service.

Inheritance diagram for Timetable_Optimisation_Recommendations.UserControls.ServiceCard:

5.49.1 Detailed Description

The service card, use to display the single service.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/UserControls/ServiceCard.xaml.cs

5.50 Timetable_Optimisation_Recommendations.Timetable_Evaluator.ServiceCohesionEvaluator Class Reference

The service cohesion evaluator works with the Evaluator class to calculate how well a services timetable works, with another service that shares a common route segment. By assigning a blame value to each timetable record based on how un-cohesive it is.

Public Member Functions

- [ServiceCohesionEvaluator](#) ([TimeTableEvaluator](#) evaluator, double? dominance=null)
The default constructor for the service cohesion evaluator object, Which takes in the parent evaluator and the fixed dominance value.
- void [FindBlameServiceCohesion](#) ([Solution](#) solution)
Works out the service cohesion for services that share a common route-segments for specific bus stops.

Properties

- static double [Dominance](#) = Properties.Settings.Default.CohesionDominance [get]
The fixed dominance value.

5.50.1 Detailed Description

The service cohesion evaluator works with the Evaluator class to calculate how well a services timetable works, with another service that shares a common route segment. By assigning a blame value to each timetable record based on how un-cohesive it is.

5.50.2 Constructor & Destructor Documentation

5.50.2.1 ServiceCohesionEvaluator()

```
Timetable_Optimisation_Recommendations.Timetable_Evaluator.ServiceCohesionEvaluator.ServiceCohesionEvaluator (
    TimeTableEvaluator evaluator,
    double? dominance = null )
```

The default constructor for the service cohesion evaluator object, Which takes in the parent evaluator and the fixed dominance value.

Parameters

<i>evaluator</i>	Takes in the main evaluator object as reference
<i>dominance</i>	The dominance value for the cohesion blame value. Only use if you wish to override the settings value.

5.50.3 Member Function Documentation

5.50.3.1 FindBlameServiceCohesion()

```
void TImetable_Optimisation_Recommendations.TImetable_Evaluator.ServiceCohesionEvaluator.<-
FindBlameServiceCohesion (
    Solution solution )
```

Works out the service cohesion for services that share a common route-segments for specific bus stops.

Returns

A dictionary, where bus service is key, and the value is an array of tuples of timetable records and blame values. Where.....

The documentation for this class was generated from the following file:

- TImetable Optimisation Recommendations/TImetable Optimisation Recommendations/TImetable Evaluator/Service<-CohesionEvaluator.cs

5.51 TImetable_Optimisation_Recommendations.Windows.Settings Class Reference

The main settings page for the application.

Inheritance diagram for TImetable_Optimisation_Recommendations.Windows.Settings:

Public Member Functions

- [Settings \(\)](#)
The default constructor, sets up the GUI.

5.51.1 Detailed Description

The main settings page for the application.

5.51.2 Constructor & Destructor Documentation

5.51.2.1 Settings()

```
Timetable_Optimisation_Recommendations.Windows.Settings.Settings ( )
```

The default constructor, sets up the GUI.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Windows/Settings.↵
xaml.cs

5.52 Timetable_Optimisation_Recommendations.Timetable_Evaluator.↵ SlackTimeEvaluator Class Reference

The slack time evaluator works with the Evaluator class to calculate if the timetable has excessive slack (Or not enough). By assigning a blame value to each timetable record based on how disruptive it is to the timetable.

Public Member Functions

- [SlackTimeEvaluator](#) ([TimeTableEvaluator](#) evaluator, double? dominance=null)
Default constructor for the slack time evaluator.
- async Task [FindBlameSlackTime](#) ([Solution](#) solution, IProgress< [AdvancedProgressReporting](#) >? progress=null)
Will calculate the slack time blame values for all of the services needed in the evaluator
- async Task [FindSingleBlameSlackTime](#) ([BlamedBusTimeTable](#)[] serviceTimetable, IProgress< [ProgressReporting](#) >? progress=null)
Given a day worth of timetable data go through every record and then assign a blame value to each record. Return this list of tuples to then decide what problem areas to focus upon.

Static Public Member Functions

- static void [StandardiseSolution](#) ([Solution](#) unstandardised)
Takes in an array of unstandardised blame records, and then standardises their slack time value, such that it can be compared to other blame values. It will also adjust this value, such that the pareto-dominance acts on the value.

Properties

- static double [Dominance](#) = Properties.Settings.Default.SlackTimeDominance [get]
The fixed dominance value.

5.52.1 Detailed Description

The slack time evaluator works with the Evaluator class to calculate if the timetable has excessive slack (Or not enough). By assigning a blame value to each timetable record based on how disruptive it is to the timetable.

5.52.2 Constructor & Destructor Documentation

5.52.2.1 SlackTimeEvaluator()

```
Timetable_Optimisation_Recommendations.Timetable_Evaluator.SlackTimeEvaluator.SlackTime←
Evaluator (
    TimeTableEvaluator evaluator,
    double? dominance = null )
```

Default constructor for the slack time evaluator.

Parameters

<i>evaluator</i>	The evaluator object, which stores the current proposed solution.
<i>dominance</i>	The dominance value for the slack time blame value. Only use if you wish to override the settings value.

5.52.3 Member Function Documentation

5.52.3.1 FindBlameSlackTime()

```
async Task Timetable_Optimisation_Recommendations.Timetable_Evaluator.SlackTimeEvaluator.←
FindBlameSlackTime (
    Solution solution,
    IProgress< AdvancedProgressReporting >? progress = null )
```

Will calculate the slack time blame values for all of the services needed in the evaluator

Parameters

<i>solution</i>	The solution you wish to apply slack time evaluator too. By default this will be the one in the evaluator.
<i>progress</i>	Used to report back the total progress of the task.

Returns

Once completed all blame records will have a slack value blame.

5.52.3.2 FindSingleBlameSlackTime()

```
async Task Timetable_Optimisation_Recommendations.Timetable_Evaluator.SlackTimeEvaluator.↵  
FindSingleBlameSlackTime (   
    BlamedBusTimeTable[] serviceTimetable,   
    IProgress< ProgressReporting >? progress = null )
```

Given a day worth of timetable data go through every record and then assign a blame value to each record. Return this list of tuples to then decide what problem areas to focus upon.

Parameters

<i>serviceTimetable</i>	A days worth of timetable data.
<i>progress</i>	A progress reporter to update GUI.

If you call this function you MUST standardised the results after wards. This isn't done within the function itself encase you call it several times over. Then you only need to call it after you last call to the function.

Returns

An array of timetable records and blame values.

5.52.3.3 StandardiseSolution()

```
static void Timetable_Optimisation_Recommendations.Timetable_Evaluator.SlackTimeEvaluator.↵  
StandardiseSolution (   
    Solution unstandardised ) [static]
```

Takes in an array of unstandardised blame records, and then standardises their slack time value, such that it can be compared to other blame values. It will also adjust this value, such that the pareto-dominance acts on the value.

Parameters

<i>unstandardised</i>	An array of unstandardised blame values.
-----------------------	--

Changing any timetable record, would effect all other blame records, regardless of if it was in the journey group or not. As such the unstandardised values needs to be cached.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Timetable Evaluator/Slack↵
TimeEvaluator.cs

5.53 Timetable_Optimisation_Recommendations.Search_Algorithm.↵ Tabu_Search.Solution Class Reference

Used to represent a single solution to the problem, the actual solution is stored in a dictionary, where the service is the key and an array of timetable records is the value.

Inheritance diagram for `Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.Solution`:

Public Member Functions

- [Solution](#) (`Dictionary< IBusService, BlamedBusTimeTable[]> busTimetables`)
Default constructor takes in a solution dictionary and stores it.
- `double` [ObjectiveFunctionValue](#) ()
Returns back an objective function value for the current solution, a lower score is better. Values can only be compared against solutions to the same problem. These are not standardised between different searches.
- `void` [CalculateTotalBlames](#) ()
Goes through every record in the solution space and updates their weights to the new total weight.
- [Solution ReplaceMove](#) ([Move](#) move)
Creates a deep-clone of thew current solution and then replaces a move in the solution space. Returns the copy of the solution with the altered move.
- `int` [ScoreOfService](#) ([IBusService](#) service)
Returns the objective function score of in single service in the solution. This can be used to work out how much one service has improved.
- `object` [Clone](#) ()
Creates a deep-clone of the object, this will shallow-clone the object and then deep-clone the bus-timetable solution dictionary.

Properties

- `Dictionary< IBusService, BlamedBusTimeTable[]> BusTimeTables` [get]
Stores the solution, as a set of timetable records for a day with an associated service.

5.53.1 Detailed Description

Used to represent a single solution to the problem, the actual solution is stored in a dictionary, where the service is the key and an array of timetable records is the value.

5.53.2 Constructor & Destructor Documentation

5.53.2.1 Solution()

```

Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.Solution.Solution (
    Dictionary< IBusService, BlamedBusTimeTable[]> busTimetables )
  
```

Default constructor takes in a solution dictionary and stores it.

Parameters

<i>busTimetables</i>	
----------------------	--

5.53.3 Member Function Documentation

5.53.3.1 CalculateTotalBlames()

```
void Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.Solution.Calculate↵  
TotalBlames ( )
```

Goes through every record in the solution space and updates their weights to the new total weight.

5.53.3.2 Clone()

```
object Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.Solution.Clone ( )
```

Creates a deep-clone of the object, this will shallow-clone the object and then deep-clone the bus-timetable solution dictionary.

Returns

A deep-clone of "this" object.

5.53.3.3 ObjectiveFunctionValue()

```
double Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.Solution.Objective↵  
FunctionValue ( )
```

Returns back an objective function value for the current solution, a lower score is better. Values can only be compared against solutions to the same problem. These are not standardised between different searches.

Returns

An object function value, lower the score the better the solution. Zero being the "perfect" timetable.

5.53.3.4 ReplaceMove()

```
Solution Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.Solution.Replace↵  
Move (   
        Move move )
```

Creates a deep-clone of the current solution and then replaces a move in the solution space. Returns the copy of the solution with the altered move.

Parameters

<i>move</i>	The move to replace the service with.
-------------	---------------------------------------

Returns**5.53.3.5 ScoreOfService()**

```
int Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.Solution.ScoreOf↵
Service (
    IBusService service )
```

Returns the objective function score of in single service in the solution. This can be used to work out how much one service has improved.

Parameters

<i>service</i>	The service in the solution to generate a score for. If not in the solution 0.
----------------	--

Returns

Objective score of one service in the solution.

5.53.4 Property Documentation**5.53.4.1 BusTimeTables**

```
Dictionary<IBusService, BlamedBusTimeTable[]> Timetable_Optimisation_Recommendations.Search↵
_Algorithm.Tabu_Search.Solution.BusTimeTables [get]
```

Stores the solution, as a set of timetable records for a day with an associated service.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Search Algorithm/↵
Tabu Search/Solution.cs

5.54 Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator Class Reference

The default operator if none is selected, this is mainly used to satisfy the null-ability requirement of C# then anything else.

Inheritance diagram for Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator:

Public Member Functions

- void [ForceUpdateCache](#) ()
Forces the current data stored in the bus operator object to be saved into Cache. You would need to do this if you've made some lazy API requests.
- [IBusStop](#) [GetLocation](#) (string atcoCode)
Get a bus stop location based upon a bus stops location code
- [IBusService](#) [GetService](#) (string serviceNumber)
Returns a service which matches the Service Number passed.
- [IBusService](#)[] [GetServices](#) ()
Gets an array of all the IBusServices Objects.
- void [InvalidateCache](#) ()
Deletes any Cache data stored, use this only if you need to force new data cache.
- bool [IsLocation](#) (string atcoCode)
Checks to see if the atco code for the bus stop exists in the API feed or not.
- bool [IsService](#) (string serviceNumber)
Checks to see if a service of that number exists or not in the API feed.

5.54.1 Detailed Description

The default operator if none is selected, this is mainly used to satisfy the null-ability requirement of C# then anything else.

5.54.2 Member Function Documentation

5.54.2.1 ForceUpdateCache()

```
void Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator.ForceUpdateCache ( )
```

Forces the current data stored in the bus operator object to be saved into Cache. You would need to do this if you've made some lazy API requests.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator](#).

5.54.2.2 GetLocation()

```
IBusStop Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator.Get↔  
Location (   
    string atcoCode )
```

Get a bus stop location based upon a bus stops location code

Parameters

<i>atcoCode</i>	The code of the bus stop
-----------------	--------------------------

Returns

A Bus Stop object for the Atco Code specified.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator](#).

5.54.2.3 GetService()

```
IBusService Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator.↔  
GetService (   
    string serviceName )
```

Returns a service which matches the Service Number passed.

Parameters

<i>serviceName</i>	The service number/ID for the service you wish to be returned eg: 17 or 22.
--------------------	---

Returns

The services matching the ID.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator](#).

5.54.2.4 GetServices()

```
IBusService [ ] Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator.↔  
GetServices ( )
```

Gets an array of all the IBusServices Objects.

Returns

An array of all the bus services.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator](#).

5.54.2.5 InvalidateCache()

```
void Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator.InvalidateCache ( )
```

Deletes any Cache data stored, use this only if you need to force new data cache.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator](#).

5.54.2.6 IsLocation()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator.IsLocation (
    string atcoCode )
```

Checks to see if the atco code for the bus stop exists in the API feed or not.

Parameters

<i>atcoCode</i>	The ID Code for a bus stop.
-----------------	-----------------------------

Returns

True or False depending on if the stop is in the API feed or not.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator](#).

5.54.2.7 IsService()

```
bool Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.StubOperator.IsService (
    string serviceNumber )
```

Checks to see if a service of that number exists or not in the API feed.

Parameters

<i>serviceNumber</i>	The service number to find.
----------------------	-----------------------------

Returns

True or False for if a service is the API feed or not.

Implements [Timetable_Optimisation_Recommendations.Bus_Operator_API_Interface.IBusOperator](#).

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Bus Operator API Interface/StubOperator.cs

5.55 Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.TabuList Class Reference

[TabuList](#) keeps track of what moves are tabu/invalid and what moves can now be performed. Moves are tabu while the tabu tenure is greater than zero.

Public Member Functions

- [TabuList](#) (int? tabuTenure=null)
An optional constructor used to manually specify the TabuTenure, only use if you want to override the settings value.
- void [SetTabu](#) ([Move](#) move)
Once a move has been accepted it needs to be made tabu, and previous tabu records updated.
- bool [IsTabu](#) ([Move](#) move)
Returns true if the move is going to be editing a tabu-timetable record or not. Therefore, false is an allowed move.
- bool [IsTabu](#) ([IBusTimeTable](#) record)
Returns true if the record is considered tabu or not.
- void [FreeUpTabuListEarly](#) ()
Used if all of the search space has become tabu, this should only happen if the user has set a really long tabu tenure or if they have a really small search space. It will go through and decrement all keys by one in the hopes that some are removed.

5.55.1 Detailed Description

[TabuList](#) keeps track of what moves are tabu/invalid and what moves can now be performed. Moves are tabu while the tabu tenure is greater than zero.

5.55.2 Constructor & Destructor Documentation

5.55.2.1 TabuList()

```
Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.TabuList.TabuList (
    int? tabuTenure = null )
```

An optional constructor used to manually specify the TabuTenure, only use if you want to override the settings value.

Parameters

<i>tabuTenure</i>	
-------------------	--

5.55.3 Member Function Documentation

5.55.3.1 FreeUpTabuListEarly()

```
void Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.TabuList.FreeUpTabu←  
ListEarly ( )
```

Used if all of the search space has become tabu, this should only happen if the user has set a really long tabu tenure or if they have a really small search space. It will go through and decrement all keys by one in the hopes that some are removed.

5.55.3.2 IsTabu() [1/2]

```
bool Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.TabuList.IsTabu (   
    IBusTimeTable record )
```

Returns true if the record is considered tabu or not.

Parameters

<i>record</i>	A timetable record.
---------------	---------------------

Returns

True if this record is tabu.

5.55.3.3 IsTabu() [2/2]

```
bool Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.TabuList.IsTabu (   
    Move move )
```

Returns true if the move is going to be editing a tabu-timetable record or not. Therefore, false is an allowed move.

Parameters

<i>move</i>	The move to evaluate if it's tabu or not.
-------------	---

Returns

True or False for if it's tabu or not.

5.55.3.4 SetTabu()

```
void Timetable_Optimisation_Recommendations.Search_Algorithm.Tabu_Search.TabuList.SetTabu (
    Move move )
```

Once a move has been accepted it needs to be made tabu, and previous tabu records updated.

Parameters

<i>move</i>	The new move just been performed.
-------------	-----------------------------------

The documentation for this class was generated from the following file:

Tabu Search/TabuList.cs

5.56 Timetable_Optimisation_Recommendations.Timetable_Simulator.↔ TimeSimulator Class Reference

Shared common code used between both the Journey Time Simulator and the Dwell Time Simulator. Manila the weighted averaging code and accuracy measures.

Inheritance diagram for Timetable_Optimisation_Recommendations.Timetable_Simulator.TimeSimulator:

Static Protected Member Functions

- static double [CalculateInverseWeight](#) (double value1)
Calculates the inverse of a value, but if the value is less than one just return one.
- static double [CalculateInverseWeight](#) (double value1, double value2)
Calculates the inverse of the smallest of the two values, but if the smallest value is less than one, just return one.
- static TimeSpan [GenerateWeightedAverage](#) (List<(TimeSpan duration, double accuracyWeight)> times)
Given a list of estimated durations and their estimated accuracy/ confidence level generate the weighted average of all the values.

5.56.1 Detailed Description

Shared common code used between both the Journey Time Simulator and the Dwell Time Simulator. Manila the weighted averaging code and accuracy measures.

5.56.2 Member Function Documentation

5.56.2.1 CalculateInverseWeight() [1/2]

```
static double Timetable_Optimisation_Recommendations.Timetable_Simulator.TimeSimulator.↵  
CalculateInverseWeight (  
    double value1 )    [static], [protected]
```

Calculates the inverse of a value, but if the value is less than one just return one.

Parameters

<i>value1</i>	Value to inverse
---------------	------------------

Returns

Inverses the value, unless less than one, then return one.

5.56.2.2 CalculateInverseWeight() [2/2]

```
static double Timetable_Optimisation_Recommendations.Timetable_Simulator.TimeSimulator.↵
CalculateInverseWeight (
    double value1,
    double value2 ) [static], [protected]
```

Calculates the inverse of the smallest of the two values, but if the smallest value is less than one, just return one.

Parameters

<i>value1</i>	Value one
<i>value2</i>	Value two

Returns

The inverse of the smallest of the two values, unless less than one, then return one.

5.56.2.3 GenerateWeightedAverage()

```
static TimeSpan Timetable_Optimisation_Recommendations.Timetable_Simulator.TimeSimulator.↵
GenerateWeightedAverage (
    List<(TimeSpan duration, double accuracyWeight)> times ) [static], [protected]
```

Given a list of estimated durations and their estimated accuracy/ confidence level generate the weighted average of all the values.

Parameters

<i>times</i>	A list of tuples of estimated durations and accuracy
--------------	--

Returns

The new single weighted average of all the values.

The documentation for this class was generated from the following file:

- [Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Timetable Simulator/TimeTableEvaluator.cs](#)

5.57 Timetable_Optimisation_Recommendations.Timetable_Evaluator.TimeTableEvaluator Class Reference

The main evaluator entry point, give it a set of dates where you want to use data from, an initial starting solution and a route-segment collection and then it can improve upon the timetable.

Public Member Functions

- [TimeTableEvaluator](#) ([DateTime\[\]](#) relatedDates, [RouteSegmentCollection](#) segmentCollection, [Dictionary<IBusService, IBusTimeTable\[\]>](#) busTimeTables)
The default constructor for the main evaluator.
- [async Task<bool>](#) [PerformIterationAsync](#) ([IProgress<AdvancedProgressReporting>](#)? progress=null)
Performs one iteration of the search algorithm, once it's completed the solution will have changed by one move.

Public Attributes

- [Solution?](#) [Solution](#)
- [string](#)
Used to tell what the last solution score was and to show if it has been improving or not.

Properties

- [DateTime\[\]](#) [RelatedDates](#) [get]
Dates when the timetables where the same in the year.
- [Solution](#) [CurrentSolution](#) [get]
value> The initial start solution.
- [Solution?](#) [StartSolution](#) [get]
value> The best solution found in any iteration
- [List<\(Move, int\)>](#) [MovesMade](#) = new() [get]
value> Stores information about shared route-segment collections.
- [RouteSegmentCollection](#) [Collection](#) [get]

5.57.1 Detailed Description

The main evaluator entry point, give it a set of dates where you want to use data from, an initial starting solution and a route-segment collection and then it can improve upon the timetable.

5.57.2 Constructor & Destructor Documentation

5.57.2.1 TimeTableEvaluator()

```
Timetable_Optimisation_Recommendations.Timetable_Evaluator.TimeTableEvaluator.TimeTableEvaluator (
    DateTime[] relatedDates,
    RouteSegmentCollection segmentCollection,
    Dictionary< IBusService, IBusTimeTable[]> busTimeTables )
```

The default constructor for the main evaluator.

Parameters

<i>relatedDates</i>	A set of dates where the timetables were the same and to look for data.
<i>segmentCollection</i>	A route-segment collection, to find the common-shared path segments.
<i>busTimeTables</i>	The current timetable/ initial proposed solution.

5.57.3 Member Function Documentation

5.57.3.1 PerformIterationAsync()

```
async Task<bool> Timetable_Optimisation_Recommendations.Timetable_Evaluator.TimeTableEvaluator.<←
PerformIterationAsync (
    IProgress< AdvancedProgressReporting >? progress = null )
```

Performs one iteration of the search algorithm, once it's completed the solution will have changed by one move.

Returns

Updates the solution by one move improving the solution. Returns true or false for if you can perform another subsequent move.

5.57.4 Member Data Documentation

5.57.4.1 string

```
Timetable_Optimisation_Recommendations.Timetable_Evaluator.TimeTableEvaluator.string
```

Used to tell what the last solution score was and to show if it has been improving or not.

Returns

A string to say the score/progress of the algorithm, along with a boolean value. True - Has improved since last move. False- Gotten worse since last move.

5.57.5 Property Documentation

5.57.5.1 RelatedDates

```
DateTime [] Timetable_Optimisation_Recommendations.Timetable_Evaluator.TimeTableEvaluator.RelatedDates [get]
```

Dates when the timetables where the same in the year.

value>The current proposed solution.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Timetable Evaluator/TimeTableEvaluator.cs

5.58 Timetable_Optimisation_Recommendations.Timetable_Analyser.TimeTableGrouper Class Reference

The grouper class can be used to help find patterns in the timetable where several days shared the same timetable.

Public Member Functions

- [TimeTableGrouper](#) ([IBusService](#) service)
The default constructor for the grouper.
- async Task< [Cluster](#)[]> [FindGroupings](#) ([IProgress](#)< [ProgressReporting](#) > progress, DateTime startDate, DateTime endDate)
Finds an array of clusters, within the timetable data between two dates. If every day had a new timetable then you would have one cluster per day.

5.58.1 Detailed Description

The grouper class can be used to help find patterns in the timetable where several days shared the same timetable.

5.58.2 Constructor & Destructor Documentation

5.58.2.1 TimeTableGrouper()

```
Timetable_Optimisation_Recommendations.Timetable_Analyser.TimeTableGrouper.TimeTableGrouper (
    IBusService service )
```

The default constructor for the grouper.

Parameters

service	The service for which you wish to find groupings.
-------------------------	---

5.58.3 Member Function Documentation

5.58.3.1 FindGroupings()

```
async Task<Cluster[ ]> Timetable_Optimisation_Recommendations.Timetable_Analyser.TimeTable↵
Grouper.FindGroupings (
    IProgress< ProgressReporting > progress,
    DateTime startDate,
    DateTime endDate )
```

Finds an array of clusters, within the timetable data between two dates. If every day had a new timetable then you would have one cluster per day.

Parameters

<i>progress</i>	The progress for how far along it is.
<i>startDate</i>	The start date to find a group in.
<i>endDate</i>	The end date to find a group in.

Returns

An array of found groups.

This does currently NOT work for a service which operates over night and might have a different start and end day. This is assuming that the start and end day is on the same day.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Timetable Analyser/Time↵
TableGrouper.cs

5.59 Timetable_Optimisation_Recommendations.Request_Manager.↵ TimetableRetrieval Class Reference

Used to get a batch/ multiple-days worth of timetable data in a single query. However, this still has to be done sequentially because the Reading Buses API doesn't like having more than one database connection open at once.

Static Public Member Functions

- static async Task< IBusHistoricTimeTable[]> **GetHistoricTimeTableBatch** (DateTime start, DateTime end, IBusService service, IProgress< double >? progress=null)
Gets multiple days worth of historical time table data for a particular service between two date and times.
- static async Task< IBusTimeTable[]> **GetTimeTableBatch** (DateTime start, DateTime end, IBusService service, IProgress< ProgressReporting >? progress=null)
Gets multiple days worth of planned time table data for a particular service between two dates and times.
- static async Task< IBusSolidHistoricTimeTable[]> **GetHistoricTimeTableBatch** (DateTime[] cluster, IBusStop stop, IProgress< double >? progress=null)
Gets multiple days worth of historical time table data for a particular service between two date and times.
- static async Task< IBusSolidHistoricTimeTable[]> **GetHistoricTimeTableBatch** (DateTime[] cluster, IBusService service, IProgress< double >? progress=null)

5.59.1 Detailed Description

Used to get a batch/ multiple-days worth of timetable data in a single query. However, this still has to be done sequentially because the Reading Buses API doesn't like having more than one database connection open at once.

5.59.2 Member Function Documentation

5.59.2.1 GetHistoricTimeTableBatch() [1/2]

```
static async Task<IBusHistoricTimeTable[][]> Timetable_Optimisation_Recommendations.Request↵
_Manager.TimetableRetrieval.GetHistoricTimeTableBatch (
    DateTime start,
    DateTime end,
    IBusService service,
    IProgress< double >? progress = null ) [static]
```

Gets multiple days worth of historical time table data for a particular service between two date and times.

Parameters

<i>progress</i>	Used to return back to the GUI the current progress of the task.
<i>start</i>	The start date, should be oldest into the past.
<i>end</i>	The end date for when you want to go up to, inclusive.
<i>service</i>	The service for which you want historical time table data for.

Returns

Gets all the days of historic timetable data between the two dates inclusive.

The days will not necessarily be in order, they are in the order in which the API sent data. If the ordering is important you must re-order it.

5.59.2.2 GetHistoricTimeTableBatch() [2/2]

```
static async Task<IBusSolidHistoricTimeTable[][]> Timetable_Optimisation_Recommendations.↵
Request_Manager.TimetableRetrieval.GetHistoricTimeTableBatch (
    DateTime[] cluster,
    IBusStop stop,
    IProgress< double >? progress = null ) [static]
```

Gets multiple days worth of historical time table data for a particular service between two date and times.

Parameters

<i>progress</i>	Used to return back to the GUI the current progress of the task.
<i>stop</i>	The stop for which you want historical time table data for.
<i>cluster</i>	Used to get back data for a service at a specif cluster of dates.

Returns

5.59.2.3 GetTimeTableBatch()

```
static async Task<IBusTimeTable[][]> Timetable_Optimisation_Recommendations.Request_Manager.↔
TimetableRetrieval.GetTimeTableBatch (
    DateTime start,
    DateTime end,
    IBusService service,
    IProgress< ProgressReporting >? progress = null ) [static]
```

Gets multiple days worth of planned time table data for a particular service between two dates and times.

Parameters

<i>progress</i>	Used to return back to the GUI the current progress of the task.
<i>start</i>	The start date, should be oldest into the past.
<i>end</i>	The end date for when you want to go up to, inclusive.
<i>service</i>	The service for which you want planned time table data for.

Returns

Gets all the days of timetable data between the two dates inclusive.

The days will not necessarily be in order, they are in the order in which the API sent data. If the ordering is important you must re-order it.

ager/Timetable_Retrieval.cs

5.60 Timetable_Optimisation_Recommendations.Windows.View↔ Timetable Class Reference

Used to display the timetable to the user.

Inheritance diagram for Timetable_Optimisation_Recommendations.Windows.ViewTimetable:

Public Member Functions

- [ViewTimetable](#) ([IBusTimeTable](#)[] records, [IBusService](#) service)

The default constructor for the timetable viewer.

5.60.1 Detailed Description

Used to display the timetable to the user.

5.60.2 Constructor & Destructor Documentation

5.60.2.1 ViewTimetable()

```
Timetable_Optimisation_Recommendations.Windows.ViewTimetable.ViewTimetable (
    IBusTimeTable[] records,
    IBusService service )
```

The default constructor for the timetable viewer.

Parameters

<i>records</i>	The timetable to display.
<i>service</i>	The service it is about.

The documentation for this class was generated from the following file:

- Timetable_Optimisation_Recommendations/Timetable_Optimisation_Recommendations/Windows/ViewTimetable.xaml.cs

5.61 Timetable_Optimisation_Recommendations.Windows.ViewTimetableHighlighted Class Reference

Interaction logic for ViewTimetable.xaml

Inheritance diagram for Timetable_Optimisation_Recommendations.Windows.ViewTimetableHighlighted:

Public Member Functions

- [ViewTimetableHighlighted](#) ([BlamedBusTimeTable](#)[] records, [IBusService](#) service, string percentageChange, [Move](#)[]? moves=null)

The default constructor for the view timetable highlights window.

5.61.1 Detailed Description

Interaction logic for ViewTimetable.xaml

5.61.2 Constructor & Destructor Documentation

5.61.2.1 ViewTimetableHighlighted()

```
Timetable_Optimisation_Recommendations.Windows.ViewTimetableHighlighted.ViewTimetableHighlighted
(
    BlamedBusTimeTable[] records,
    IBusService service,
    string percentageChange,
    Move?[] moves = null )
```

The default constructor for the view timetable highlights window.

Parameters

<i>records</i>	The timetable with blame values to display and highlight.
<i>service</i>	The service it pertains too.
<i>percentageChange</i>	The percentage improvement compared to the original timetable.
<i>moves</i>	The moves that the search algorithm made.

The documentation for this class was generated from the following file:

- Timetable Optimisation Recommendations/Timetable Optimisation Recommendations/Windows/View↔
TimetableHighlighted.xaml.cs

5.62 Timetable_Optimisation_Recommendations.Timetable_Evaluator.↔ Weights Class Reference

The weights class is used to store a target arrival and departure time, along with a raw and standardised weight for how much it should pull towards it.

Inheritance diagram for Timetable_Optimisation_Recommendations.Timetable_Evaluator.Weights:

Public Member Functions

- object [Clone](#) ()

Performs a shallow copy of the weights object. But deep-copy would do the same as there are no object references in this class.

Properties

- double? [Weight](#) = null [get, set]
The overall weight. This might be standardised, but will always be an absolute value.
- double? [RawWeight](#) [get, set]
value> The Arrival Time value the weight is pulling towards.
- DateTime [TargetSchArrivalTime](#) [get, set]
value> The Departure Time value the weight is pulling towards.
- DateTime [TargetSchDepartureTime](#) [get, set]

5.62.1 Detailed Description

The weights class is used to store a target arrival and departure time, along with a raw and standardised weight for how much it should pull towards it.

5.62.2 Member Function Documentation

5.62.2.1 Clone()

```
object Timetable_Optimisation_Recommendations.Timetable_Evaluator.Weights.Clone ( )
```

Performs a shallow copy of the weights object. But deep-copy would do the same as there are no object references in this class.

Returns

A copy of the object.

5.62.3 Property Documentation

5.62.3.1 Weight

```
double? Timetable_Optimisation_Recommendations.Timetable_Evaluator.Weights.Weight = null  
[get], [set]
```

The overall weight. This might be standardised, but will always be an absolute value.

value> The raw non-standardised and non-absolute weight used between iterations to regenerate the new standardised weight if possible. This is used mainly for speed and efficiency purposes rather than anything else.

The documentation for this class was generated from the following file:
